AM3358-EP Sitara™ 处理器

1 器件概述

中的 PRU-ICSS、AVS、和 DVFS 列表项

1.1 特性

- 高达 800MHz Sitara™ ARM® Cortex®-A8 32 位精简指令集计算机 (RISC) 处理器
  - NEON™ 单指令流多数据流 (SIMD) 协处理器
  - 32KB L1 指令和 32KB 带有单位检错（奇偶校验）的数据缓存
  - 带有错误校正码 (ECC) 的 256KB L2 缓存
  - 176KB 片载启动 ROM
  - 64KB 专用 RAM
  - 仿真和调试 - JTAG
  - 中断控制器（最多可控制 128 个中断请求）
- 片上存储器（共享 L3 RAM）
  - 64KB 通用片上存储器控制器 (OCMC) 随机存取存储器 (RAM)
  - 可访问所有主机
  - 支持保持以实现快速唤醒
- 外部存储器接口 (EMIF)
  - mDDR(LPDDR)、DDR2、DDR3、DDR3L 控制器：
    - mDDR：200MHz 时钟（400MHz 数据速率）
    - DDR2：266MHz 时钟（532MHz 数据速率）
    - DDR3：400MHz 时钟（800MHz 数据速率）
    - DDR3L：400MHz 时钟（800MHz 数据速率）
    - 16 位数据总线
    - 1GB 全部可寻址空间
    - 支持一个 x16 或两个 x8 存储器件配置
  - 通用存储器控制器 (GPMC)
    - 灵活的 8 位和 16 位异步存储器接口，具有多达七个片选（NAND、NOR、复用 NOR 和 SRAM）
    - 使用 BCH 代码，支持 4 位、8 位或 16 位 ECC
    - 使用海明码来支持 1 位 ECC
  - 错误定位器模块 (ELM)
    - 与 GPMC 一起使用时，可通过 BCH 算法确定所生成的伴随多项式中数据错误的地址
    - 根据 BCH 算法，支持 4 位、8 位和 16 位每 512 字节块错误定位
- 可编程实时单元子系统和工业通信子系统 (PRU-ICSS)
  - 支持 PROFIBUS、PROFINET、EtherNet/IP™ 等协议
  - 2个可编程实时单元(PRU)
    - 32位可运行在200MHz的负载/存储RISC处理器
    - 8KB 带有单位检错（奇偶校验）的指令 RAM
    - 8KB 带有单位检错（奇偶校验）的数据 RAM
    - 具有 64 位累加器的单周期 32 位乘法器
    - 增强型 GPIO 模块为外部信号提供移入/移出支持以及并行锁断
  - 12KB 带有单位检错（奇偶校验）的共享 RAM
  - 三个 120 字节寄存器组，可被每个 PRU 访问
  - 用于处理系统输入事件的中断控制器模块 (INTC)
  - 用于将内部和外部主机连接到 PRU-ICSS 内部资源的本地互连总线
  - PRU-ICSS 内的外设：
    - 一个带有流控制引脚的通用异步收发器 (UART) 端口，支持高达 12Mbps 的数据速率
    - 一个增强型捕捉 (eCAP) 模块
    - 两个 MII 以太网端口，支持工业以太网
    - 一个 MDIO 端口
- 电源、复位和时钟管理 (PRCM) 模块
  - 控制待机模式和深度休眠模式的进入和退出
  - 负责休眠排序、电源域关闭排序、唤醒排序和电源域打开排序
  - 时钟
    - 集成了 15MHz 至 35MHz 的高频振荡器，用于为各种系统和外设时钟生成参考时钟
    - 支持子系统和外设的单独时钟使能和禁用控制，帮助降低功耗
    - 五个用于生成系统时钟（MPU 子系统、DDR 接口、USB、外设 [MMC 和 SD、UART、SPI、I^2C]、L3、L4、以太网、GFX [SGX530]以及 LCD 像素时钟）的 ADPLL
  - 电源
    - 两个不可切换的电源域（实时时钟 [RTC] 和唤醒逻辑 [WAKEUP]）
    - 3 个可切换电源域（MPU 子系统 [MPU]，SGX530 [GFX]，外设和基础设施 [PER]）
    - 执行 SmartReflex™ 2B 类，基于芯片温度、过程变化和性能实现内核电压调节（自适应电压调节 [AVS]）
    - 动态电压频率缩放 (DVFS)
- 实时时钟 (RTC)
  - 实时日期（年、月、日和星期几）和时间（小时、分钟和秒）信息
  - 内部 32.768kHz 振荡器，RTC 逻辑和 1.1V 内部低压降稳压器 (LDO)
  - 独立的加电复位 (RTC_PWRONRSTn) 输入
  - 用于外部唤醒事件的专用输入引脚(EXT_

WAKEUP)
  - 可编程警报可用于生成 PRCM 内部中断（用于唤醒）或 Cortex-A8 内部中断（用于事件通知）
  - 可编程警报可与外部输出 (PMIC_POWER_EN) 一起用来使能电源管理 IC，从而恢复非 RTC 电源域
- 外设
  - 多达两个带有集成 PHY 的 USB 2.0 高速 OTG 端口
  - 多达两个工业千兆位以太网 MAC（10、100 和 1000Mbps）
    - 集成开关
    - 每个 MAC 都支持 MII、RMII、RGMII 和 MDIO 接口
    - 以太网 MAC 和交换机可独立于其它功能运行
    - IEEE 1588v2 精密时间协议 (PTP)
  - 多达 2 个控制器局域网 (CAN) 端口
    - 支持 CAN 版本 2 部分 A 和 B
  - 多达两个多通道音频串行端口 (McASP)
    - 高达 50MHz 的发送和接收时钟
    - 每个具有独立 TX 和 RX 时钟的 McASP 端口对应多达四个串行数据引脚
    - 支持时分多路复用 (TDM)、内部 IC 声音 (I2S) 和类似格式
    - 支持数字音频接口传输（SPDIF、IEC60958-1 和 AES-3 格式）
    - 用于发送和接收的 FIFO 缓冲器（256 字节）
  - 最多 6 个 UART
    - 所有 UART 支持 IrDA 和 CIR 模式
    - 所有 UART 支持 RTS 和 CTS 流量控制
    - UART1 支持完整的调制解调器控制
  - 多达两个主从 McSPI 串行接口
    - 最多 2 个芯片选择
    - 高达48 MHz
  - 多达三个 MMC、SD 和 SDIO 端口
    - 1 位、4 位和 8 位 MMC、SD 和 SDIO 模式
    - MMCSD0 具有专用于 1.8V 或 3.3V 操作的电源轨
    - 高达 48MHz 的数据传输速率
    - 支持卡检测和写保护
    - 符合 MMC4.3、SD 和 SDIO 2.0 规范
  - 多达三个 I^2C 主从接口
    - 标准模式（高达 100kHz）
    - 快速模式（高达 400kHz）
  - 多达四组通用 I/O (GPIO) 引脚
    - 每组包含 32 个 GPIO 引脚（与其他功能引脚复用）
    - GPIO 引脚可作为中断输入（每组多达两个中断输入）
  - 多达三个外部直接存储器访问 (DMA) 事件输入也可用作中断输入
  - 八个 32 位通用定时器
    - DMTIMER1 是用于操作系统 (OS) 节拍的 1ms 定时器
    - DMTIMER4–DMTIMER7 为引脚输出
  - 一个安全装置定时器
  - SGX530 3D 图形引擎
    - 拼图架构每秒可提供最多 2000 万个多边形
    - 通用可扩展着色引擎 (USSE) 是一款包含像素和顶点着色功能的多线程引擎
    - 超过 Microsoft VS3.0、PS3.0 和 OGL2.0 的高级着色功能集
    - Direct3D Mobile、OGL-ES 1.1 和 2.0、OpenVG 1.0 以及 OpenMax 的行业标准 API 支持
    - 精细的任务切换、负载均衡和电源管理
    - 高级几何 DMA 驱动型操作，最大程度地减少 CPU 交互
    - 可编程高质量图像防锯齿
    - 用于统一存储器架构中操作系统运行的完全虚拟化存储器寻址
  - LCD 控制器
    - 多达 24 位数据输出；每像素 8 位 (RGB)
    - 分辨率最高可达 2048 × 2048（具有最高 126MHz 的像素时钟）
    - 集成 LCD 接口显示驱动器 (LIDD) 控制器
    - 集成光栅控制器
    - 集成 DMA 引擎可通过中断或固件定时器从外部帧缓冲器获取数据，无需加重处理器的负担
    - 512 字深内部 FIFO
    - 支持的显示类型：
      - 字符显示器 - 使用 LIDD 控制器对这些显示器进行编程
      - 无源矩阵 LCD 显示-使用 LCD 光栅显示控制器来为到无源显示的持续图形刷新提供定时和数据
      - 有源矩阵 LCD 显示-使用外部帧缓冲器空间和内部 DMA 引擎来驱动到控制面板的流数据
  - 12 位逐次逼近寄存器 (SAR) ADC
    - 每秒采集 200K 个样本
    - 可从 8:1 模拟开关复用的八个模拟输入中任意选择输入
    - 可配置为用作 4 线、5 线或 8 线电阻式触摸屏控制器 (TSC) 接口
  - 多达三个 32 位 eCAP 模块
    - 可配置为三个捕捉输入或者三个备用 PWM 输出
  - 多达三个增强型高分辨率 PWM 模块 (eHRPWM)
    - 具有时间和频率控制功能的 16 位专用时基计数器
    - 可配置为 6 个单端，6 个双边对称，或者 3 个双边不对称输出
  - 多达 3 个 32 位增强型正交编码脉冲 (eQEP) 模块
- 器件标识
  - 包含电子熔丝组 (FuseFarm)，其中一些位厂家可

编程
  - 生产 ID
  - 器件部件号（唯一的 JTAG ID）
  - 设备版本（可由主机 ARM 读取）
- 调试接口支持
  – 用于 ARM（Cortex-A8 和 PRCM）和 PRU-ICSS 调试的 JTAG 和 cJTAG
  – 支持器件边界扫描
  – 支持 IEEE1500
- DMA
  – 片上增强型 DMA 控制器 (EDMA) 搭载三个第三方传送控制器 (TPTC) 和一个第三方通道控制器 (TPCC)，支持多达 64 个可编程逻辑通道和 8 个 QDMA 通道。 EDMA 用于：
    - 向/从片上存储器传送
    - 向/从外部存储器（EMIF、GPMC 和从外设）传送
- 处理器间通信 (IPC)
  – 集成了基于硬件的 IPC 邮箱，以及用于 Cortex-A8、PRCM 和 PRU-ICSS 之间进程同步的 Spinlock
    - 生成中断的邮箱寄存器
      – 初启程序(Cortex-A8，PRCM)
    - 自旋锁具有 128 个软件指定的锁寄存器
- 安全性
  – 密码硬件加速器 (AES，SHA，PKA，RNG)
- 启动模式
  – 通过锁存在 PWRONRSTn 输入引脚上升沿上的启动配置引脚来选择启动模式
- 封装：
  – 324 引脚 S-PBGA-N324 封装（后缀 GCZ），0.80mm 焊球间距

1.2 应用

支持国防、航天和医疗应用：

- 受控基线
- 同一组装和测试场所
- 同一制造场所
- 在 -40°C 至 105°C 温度范围内可用
- 延长了产品生命周期
- 延长了产品变更通知周期
- 产品可追溯性

中的 PRU-ICSS 信息

1.3 说明

微处理器基于 ARM Cortex-A8 处理器，在图像、图形处理、外设以及 PROFIBUS 等工业接口选项方面得到了增强。 该器件支持高级操作系统 (HLOS)。 Linux® 和 Android™ 可从德州仪器 (TI) 免费获取。

AM3358-EP 微处理器包含的子系统如图 1-1 所示，下面简要说明了各个子系统：

微处理器单元 (MPU) 子系统基于 ARM Cortex-A8 处理器， PowerVR SGX™ 图形加速器子系统提供 3D 图形加速功能以支持显示和游戏特效。

可编程实时单元子系统和工业通信子系统 (PRU-ICSS) 与 ARM 内核彼此独立，允许单独操作和计时，以实现更高的效率和灵活性。 PRU-ICSS 支持更多外设接口和 PROFINET、EtherNet/IP、PROFIBUS、Ethernet Powerlink、Sercos 等实时协议。 此外，凭借 PRU-ICSS 的可编程特性及其对引脚、事件和所有片上系统 (SoC) 资源的访问权限，该子系统可以灵活地实现快速实时响应、专用数据处理操作以及自定义外设接口，并减轻 SoC 其他处理器内核的任务负载。中的 PRU-ICSS 段落中的 PRU-ICSS 段落

3 Device Features

表 3-1 shows the features supported by AM3358-EP device.

表 3-1. Device Features

FUNCTION	AM3358-EP
ARM® Cortex®-A8	Yes
Frequency	800 MHz
MIPS	1600
On-chip L1 cache	64 KB
On-chip L2 cache	256 KB
Graphics accelerator (SGX530)	3D
Hardware acceleration	Crypto accelerator
Programmable real-time unit subsystem and industrial communication subsystem (PRU-ICSS)	All features
On-chip memory	128 KB
Display options	LCD
General-purpose memory	1 16-bit (GPMC, NAND flash, NOR flash, SRAM)
DRAM(1)	1 16-bit (LPDDR-400, DDR2-532, DDR3-800)
Universal serial bus (USB)	GCZ: 2 ports
Ethernet media access controller (EMAC) with 2-port switch	10/100/1000
Multimedia card (MMC)	3
Controller-area network (CAN)	2
Universal asynchronous receiver and transmitter (UART)	6
Analog-to-digital converter (ADC)	8-ch 12-bit
Enhanced high-resolution PWM modules (eHRPWM)	3
Enhanced capture modules (eCAP)	3
Enhanced quadrature encoder pulse (eQEP)	3
Real-time clock (RTC)	1
Inter-integrated circuit (I^2C)	3
Multichannel audio serial port (McASP)	2
Multichannel serial port interface (McSPI)	2
Enhanced direct memory access (EDMA)	64-Ch
Input/output (I/O) supply	1.8 V, 3.3 V
Operating temperature range	-40 to 105°C

4.2 Pin Attributes

The *AM335x Sitara Processors Technical Reference Manual* (SPRUH73) and this document may reference internal signal names when discussing peripheral input and output signals since many of the AM3358-EP package terminals can be multiplexed to one of several peripheral signals. The following table has a Pin Name column that lists all device terminal names and a Signal Name column that lists all internal signal names multiplexed to each terminal which provides a cross reference of internal signal names to terminal names. This table also identifies other important terminal characteristics.

1. **BALL NUMBER:** Package ball numbers associated with each signals.
2. **PIN NAME:** The name of the package pin or terminal.
   Note: The table does not take into account subsystem terminal multiplexing options.
3. **SIGNAL NAME**: The signal name for that pin in the mode being used.
4. **MODE:** Multiplexing mode number.
   (a) Mode 0 is the primary mode; this means that when mode 0 is set, the function mapped on the terminal corresponds to the name of the terminal. There is always a function mapped on the primary mode. Notice that primary mode is not necessarily the default mode.

   Note: The default mode is the mode at the release of the reset; also see the RESET REL. MODE column.
   (b) Modes 1 to 7 are possible modes for alternate functions. On each terminal, some modes are effectively used for alternate functions, while some modes are not used and do not correspond to a functional configuration.
5. **TYPE:** Signal direction
   - I = Input
   - O = Output
   - I/O = Input and Output
   - D = Open drain
   - DS = Differential
   - A = Analog
   - PWR = Power
   - GND = Ground

   Note: In the safe_mode, the buffer is configured in high-impedance.
6. **BALL RESET STATE:** State of the terminal while the active low PWRONRSTn terminal is low.
   - 0: The buffer drives V_{OL} (pulldown or pullup resistor not activated)
     0(PD): The buffer drives V_{OL} with an active pulldown resistor
   - 1: The buffer drives V_{OH} (pulldown or pullup resistor not activated)
     1(PU): The buffer drives V_{OH} with an active pullup resistor
   - Z: High-impedance
   - L: High-impedance with an active pulldown resistor
   - H : High-impedance with an active pullup resistor
7. **BALL RESET REL. STATE:** State of the terminal after the active low PWRONRSTn terminal transitions from low to high.
   - 0: The buffer drives V_{OL} (pulldown or pullup resistor not activated)
     0(PD): The buffer drives V_{OL} with an active pulldown resistor
   - 1: The buffer drives V_{OH} (pulldown or pullup resistor not activated)
     1(PU): The buffer drives V_{OH} with an active pullup resistor
   - Z: High-impedance.
   - L: High-impedance with an active pulldown resistor
   - H : High-impedance with an active pullup resistor
8. **RESET REL. MODE:** The mode is automatically configured after the active low PWRONRSTn terminal transitions from low to high.
9. **POWER:** The voltage supply that powers the terminal's IO buffers.

10. **HYS:** Indicates if the input buffer is with hysteresis.
11. **BUFFER STRENGTH:** Drive strength of the associated output buffer.
12. **PULLUP OR PULLDOWN TYPE:** Denotes the presence of an internal pullup or pulldown resistor. Pullup and pulldown resistors can be enabled or disabled via software.
13. **IO CELL:** IO cell information.

Note: Configuring two terminals to the same input signal is not supported as it can yield unexpected results. This can be easily prevented with the proper software configuration.

(1) An internal 10 kΩ pull up is turned on when the oscillator is diasabled. The oscillator is disabled by default after power is applied.

(2) An internal 15 kΩ pull down is turned on when the oscillator is disabled. The oscillator is enabled by default after power is applied.

(3) Do not connect anything to this terminal.

(4) If sysboot[5] is low on the rising edge of PWRONRSTn, this terminal has an internal pull-down turned on after reset is released. If sysboot[5] is high on the rising edge or PWRONRSTn, this terminal will initially be driven low after reset is released then it begins to toggle at the same frequency of the XTALIN terminal.

(5) LCD_DATA[15:0] terminals are respectively SYSBOOT[15:0] inputs, latched on the rising edge of PWRONRSTn.

(6) Mode1 and Mode2 signal assignments for this terminal are only available with silicon revision 2.0 or newer devices.

(7) Mode2 signal assignment for this terminal is only available with silicon revision 2.0 or newer devices.

(8) Refer to the External Warm Reset section of the AM3358-EP Technical Reference Manual for more information related to the operation of this terminal.

(9) Reset Release Mode = 7 if sysboot[5] is low. Mode = 3 if sysboot[5] is high.

(10) Silicon revision 1.0 devices only provide the MMC2_DAT7 signal when Mode3 is selected. Silicon revision 2.0 and newer devices implement another level of pin multiplexing which provides the original MMC2_DAT7 signal or RMII2_CRS_DV signal when Mode3 is selected. This new level of of pin multiplexing is selected with bit zero of the SMA2 register. For more details refer to Section 1.2 of the AM3358-EP Technical Reference Manual.

(11) The 0(PU) indicates that this terminal is initially low based on the description in the AM3358-EP Technical Reference Manual. However, it is also has a weak internal pull up applied.

(12) The input voltage thresholds for this input are not a function of VDDSHV6. Please refer to the DC Electrical Characteristics section for details related to electrical parameters associated with this input terminal.

(13) The internal USB PHY can be configured to multiplex the UART2_TX or UART2_RX signals to this terminal. For more details refer to USB GPIO Details section of the AM3358-EP Technical Reference Manual.

(14) The internal USB PHY can be configured to multiplex the UART3_TX or UART3_RX signals to this terminal. For more details refer to USB GPIO Details section of the AM3358-EP Technical Reference Manual.

(15) This output should only be used to source the recommended crystal circuit.

(16) This parameter only applies when this USB PHY terminal is operating in UART2 mode.

(17) This parameter only applies when this USB PHY terminal is operating in UART3 mode.

(18) This terminal is a analog input used to set the switching threshold of the DDR input buffers to (2).

(19) This terminal is a analog passive signal that connects to an external 49.9 ohm 1%, 20mW reference resistor which is used to calibrate the DDR input/output buffers.

(20) This terminal is analog input that may also be configured as an open-drain output.

(21) This terminal is analog input that may also be configured as an open-source or open-drain output.

(22) This terminal is analog input that may also be configured as an open-source output.

(23) This terminal is high-Z when the oscillator is diasabled. This terminal is driven high if RTC_XTALIN is less than VIL, driven low if RTC_XTALIN is greater than VIH, and driven to a unknown value if RTC_XTALIN is between VIL and VIH when the oscillator is enabled. The oscillator is disabled by default after power is applied.

(24) This terminal is high-Z when the oscillator is diasabled. This terminal is driven high if XTALIN is less than VIL, driven low if XTALIN is greater than VIH, and driven to a unknown value if XTALIN is between VIL and VIH when the oscillator is enabled. The oscillator is enabled by default after power is applied.

(25) This terminal is not defined until all the supplies are ramped.

(26) This terminal requires two power supplies, VDDA3p3v_USB0 and VDDA1p8v_USB0. The "*" character in the power supply name is a wild card that represents "3p3v" and "1p8v".

(27) This terminal requires two power supplies, VDDA3p3v_USB1 and VDDA1p8v_USB1. The "*" character in the power supply name is a wild card that represents "3p3v" and "1p8v".

(28) Refer to section 6.2.2 for additional details about VSS_OSC.

(29) Refer to section 6.2.2 for additional details about VSS_RTC.

(30) This terminal provides a Kelvin connection to VDD_MPU. It can be connected to the power supply feedback input to provide remote sensing which compensates for voltage drop in the PCB power distribution network and package. When the Kelvin connection is not used it should be connected to the same power source as VDD_MPU.

4.3 Signal Descriptions

The AM3358-EP device contains many peripheral interfaces. In order to reduce package size and lower overall system cost while maintaining maximum functionality, many of the AM3358-EP terminals can multiplex up to eight signal functions. Although there are many combinations of pin multiplexing that are possible, only a certain number of sets, called IO Sets, are valid due to timing limitations. These valid IO Sets were carefully chosen to provide many possible application scenarios for the user.

Texas Instruments has developed a Windows-based application called Pin Mux Utility that helps a system designer select the appropriate pin-multiplexing configuration for their AM3358-EP-based product design. The Pin Mux Utility provides a way to select valid IO Sets of specific peripheral interfaces to ensure the pin-multiplexing configuration selected for a design only uses valid IO Sets supported by the AM3358-EP device.

(1) **SIGNAL NAME:** The signal name

(2) **DESCRIPTION:** Description of the signal

(3) **TYPE:** Ball type for this specific function:

- I = Input
- O = Output
- I/O = Input/Output
- D = Open drain
- DS = Differential
- A = Analog

(4) **BALL:** Package ball location

Storage temperature, T_{stg}[9]		–55	155	°C

(1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions* is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

(2) All voltage values are with respect to their associated VSS or VSSA_x.

(3) This supply is sourced from an internal LDO when RTC_KALDO_ENn is low. If RTC_KALDO_ENn is high, this supply must be sourced from an external power supply.

(4) During functional operation, this pin is a no connect.

(5) This terminal is connected to a fail-safe IO and does not have a dependence on any IO supply voltage.

(6) This parameter applies to all IO terminals which are not fail-safe and the requirement applies to all values of IO supply voltage. For example, if the voltage applied to a specific IO supply is 0 volts the valid input voltage range for any IO powered by that supply will be –0.5 to +0.3 V. Apply special attention anytime peripheral devices are not powered from the same power sources used to power the respective IO supply. It is important the attached peripheral never sources a voltage outside the valid input voltage range, including power supply ramp-up and ramp-down sequences.

(7) This terminal is connected to analog circuits in the respective USB PHY. The circuit sources a known current while measuring the voltage to determine if the terminal is connected to VSSA_USB with a resistance less than 10 Ω or greater than 100 kΩ. The terminal should be connected to ground for USB host operation or open-circuit for USB peripheral operation, and should never be connected to any external voltage source.

(8) Based on JEDEC JESD78D [*IC Latch-Up Test*].

(9) For tape and reel the storage temperature range is [–10°C; +50°C] with a maximum relative humidity of 70%. TI recommends returning to ambient room temperature before usage.

Fail-safe IO terminals are designed such they do not have dependencies on the respective IO power supply voltage. This allows external voltage sources to be connected to these IO terminals when the respective IO power supplies are turned off. The USB0_VBUS and USB1_VBUS are the only fail-safe IO terminals. All other IO terminals are not fail-safe and the voltage applied to them should be limited to the value defined by the **steady state max. Voltage at all IO pins** parameter in 节 5.1.

5.2 ESD Ratings

			VALUE	UNIT
V_{ESD}	Electrostatic discharge (ESD) performance:	Human Body Model (HBM), per ANSI/ESDA/JEDEC JS001 (1)	±2000	V
		Charged Device Model (CDM), per JESD22-C101 (2)	±500	

(1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
(2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

5.3 Power-On Hours (POH)

表 5-1. Reliability Data[(1)(2)(3)(4)]

OPERATING CONDITION	EXTENDED	
	JUNCTION TEMP (T_J)	LIFETIME (POH)[(5)]
Turbo	–40°C to 105°C	80K
OPP120	–40°C to 105°C	100K
OPP100	–40°C to 105°C	100K
OPP50	–40°C to 105°C	100K

(1) The power-on hours (POH) information in this table is provided solely for your convenience and does not extend or modify the warranty provided under TI's standard terms and conditions for TI semiconductor products.

(2) To avoid significant degradation, the device power-on hours (POH) must be limited as described in this table.

(3) Logic functions and parameter values are not assured out of the range specified in the recommended operating conditions.

(4) The above notations cannot be deemed a warranty or deemed to extend or modify the warranty under TI's standard terms and conditions for TI semiconductor products.

(5) POH = Power-on hours when the device is fully functional.

5.4 Operating Performance Points (OPPs)

Device OPPs are defined in through .

(1) The supply voltage defined by OPP100 should be applied to this power domain before the device is released from reset.

(2) This supply is sourced from an internal LDO when RTC_KALDO_ENn is low. If RTC_KALDO_ENn is high, this supply must be sourced from an external power supply.

(3) VDDS should be supplied irrespective of 1.8- or 3.3-V mode of operation of the dual-voltage IOs.

(4) For more details on power supply requirements, see 节 6.1.4.

(5) This terminal is connected to analog circuits in the respective USB PHY. The circuit sources a known current while measuring the voltage to determine if the terminal is connected to VSSA_USB with a resistance less than 10 Ω or greater than 100 kΩ. The terminal should be connected to ground for USB host operation or open-circuit for USB peripheral operation, and should never be connected to any external voltage source.

(1) Current ratings specified in this table are worst-case estimates. Actual application power supply estimates could be lower. For more information, see the *AM335x Power Consumption Summary* application report (SPRABN5).

(2) This supply is sourced from an internal LDO when RTC_KALDO_ENn is low. If RTC_KALDO_ENn is high, this supply must be sourced from an external power supply.

表 5-9 summarizes the power consumption of the AM3358-EP low-power modes.

表 5-9. AM3358-EP Low-Power Modes Power Consumption Summary

POWER MODES	APPLICATION STATE	POWER DOMAINS, CLOCKS, AND VOLTAGE SUPPLY STATES	NOM	MAX	UNIT
Standby	DDR memory is in self-refresh and contents are preserved. Wake up from any GPIO. Cortex-A8 context/register contents are lost and must be saved before entering standby. On exit, context must be restored from DDR. For wake-up, boot ROM executes and branches to system resume.	Power supplies: • All power supplies are ON. • VDD_MPU = 0.95 V (nom) • VDD_CORE = 0.95 V (nom) Clocks: • Main Oscillator (OSC0) = ON • All DPLLs are in bypass. Power domains: • PD_PER = ON • PD_MPU = OFF • PD_GFX = OFF • PD_WKUP = ON DDR is in self-refresh.	16.5	22.0	mW
Deepsleep1	On-chip peripheral registers are preserved. Cortex-A8 context/registers are lost, so the application needs to save them to the L3 OCMC RAM or DDR before entering DeepSleep. DDR is in self-refresh. For wake-up, boot ROM executes and branches to system resume.	Power supplies: • All power supplies are ON. • VDD_MPU = 0.95 V (nom) • VDD_CORE = 0.95 V (nom) Clocks: • Main Oscillator (OSC0) = OFF • All DPLLs are in bypass. Power domains: • PD_PER = ON • PD_MPU = OFF • PD_GFX = OFF • PD_WKUP = ON DDR is in self-refresh.	6.0	10.0	mW
Deepsleep0	PD_PER peripheral and Cortex-A8/MPU register information will be lost. On- chip peripheral register (context) information of PD-PER domain needs to be saved by application to SDRAM before entering this mode. DDR is in self-refresh. For wake-up, boot ROM executes and branches to peripheral context restore followed by system resume.	Power supplies: • All power supplies are ON. • VDD_MPU = 0.95 V (nom) • VDD_CORE = 0.95 V (nom) Clocks: • Main Oscillator (OSC0) = OFF • All DPLLs are in bypass. Power domains: • PD_PER = OFF • PD_MPU = OFF • PD_GFX = OFF • PD_WKUP = ON DDR is in self-refresh.	3.0	4.3	mW

5.8 Thermal Resistance Characteristics for GCZ Package

Failure to maintain a junction temperature within the range specified in Section 5.5 reduces operating lifetime, reliability, and performance—and may cause irreversible damage to the system. Therefore, the product design cycle should include thermal analysis to verify the maximum operating junction temperature of the device. It is important this thermal analysis is performed using specific system use cases and conditions. TI provides an application report to aid users in overcoming some of the existing challenges of producing a good thermal design. For more information, see *AM335x Thermal Considerations* (SPRABT1).

表 5-10 provides thermal characteristics for the package used on this device.

5.9 External Capacitors

To improve module performance, decoupling capacitors are required to suppress the switching noise generated by high frequency and to stabilize the supply voltage. A decoupling capacitor is most effective when it is close to the device, because this minimizes the inductance of the circuit board wiring and interconnects.

5.9.1 Voltage Decoupling Capacitors

表 5-11 summarizes the Core voltage decoupling characteristics.

5.9.1.1 Core Voltage Decoupling Capacitors

To improve module performance, decoupling capacitors are required to suppress high-frequency switching noise and to stabilize the supply voltage. A decoupling capacitor is most effective when located close to the AM3358-EP, because this minimizes the inductance of the circuit board wiring and interconnects.

$C_{VDDSHV5}$ (5)	10.02	µF
$C_{VDDSHV6}$ (6)	10.06	µF

(1) Typical values consist of 1 cap of 10 µF and 4 caps of 10 nF.

(2) For more details on decoupling capacitor requirements for the mDDR(LPDDR), DDR2, DDR3, DDR3L memory interface, see 节 7.7.2.1.2.6 and 节 7.7.2.1.2.7 when using mDDR(LPDDR) memory devices, 节 7.7.2.2.2.6 and 节 7.7.2.2.2.7 when using DDR2 memory devices, or 节 7.7.2.3.3.6 and 节 7.7.2.3.3.7 when using DDR3 or DDR3L memory devices.

(3) VDDS_SRAM_CORE_BG supply powers an internal LDO for SRAM supplies. Inrush currents could cause voltage drop on the VDDS_SRAM_CORE_BG supplies when the SRAM LDO is enabled after powering up VDDS_SRAM_CORE_BG terminals. A 10 µF is recommended to be placed close to the terminal and routed with widest traces possible to minimize the voltage drop on VDDS_SRAM_CORE_BG terminals.

(4) VDDS_SRAM_MPU_BB supply powers an internal LDO for SRAM supplies. Inrush currents could cause voltage drop on the VDDS_SRAM_MPU_BB supplies when the SRAM LDO is enabled after powering up VDDS_SRAM_MPU_BB terminals. A 10 µF is recommended to be placed close to the terminal and routed with widest traces possible to minimize the voltage drop on VDDS_SRAM_MPU_BB terminals.

(5) Typical values consist of 1 cap of 10 µF and 2 caps of 10 nF.

(6) Typical values consist of 1 cap of 10 µF and 6 caps of 10 nF.

5.9.2 Output Capacitors

Internal low dropout output (LDO) regulators require external capacitors to stabilize their outputs. These capacitors should be placed as close as possible to the respective terminals of the AM3358-EP device. 表 5-13 summarizes the LDO output capacitor recommendations.

表 5-13. Output Capacitor Characteristics

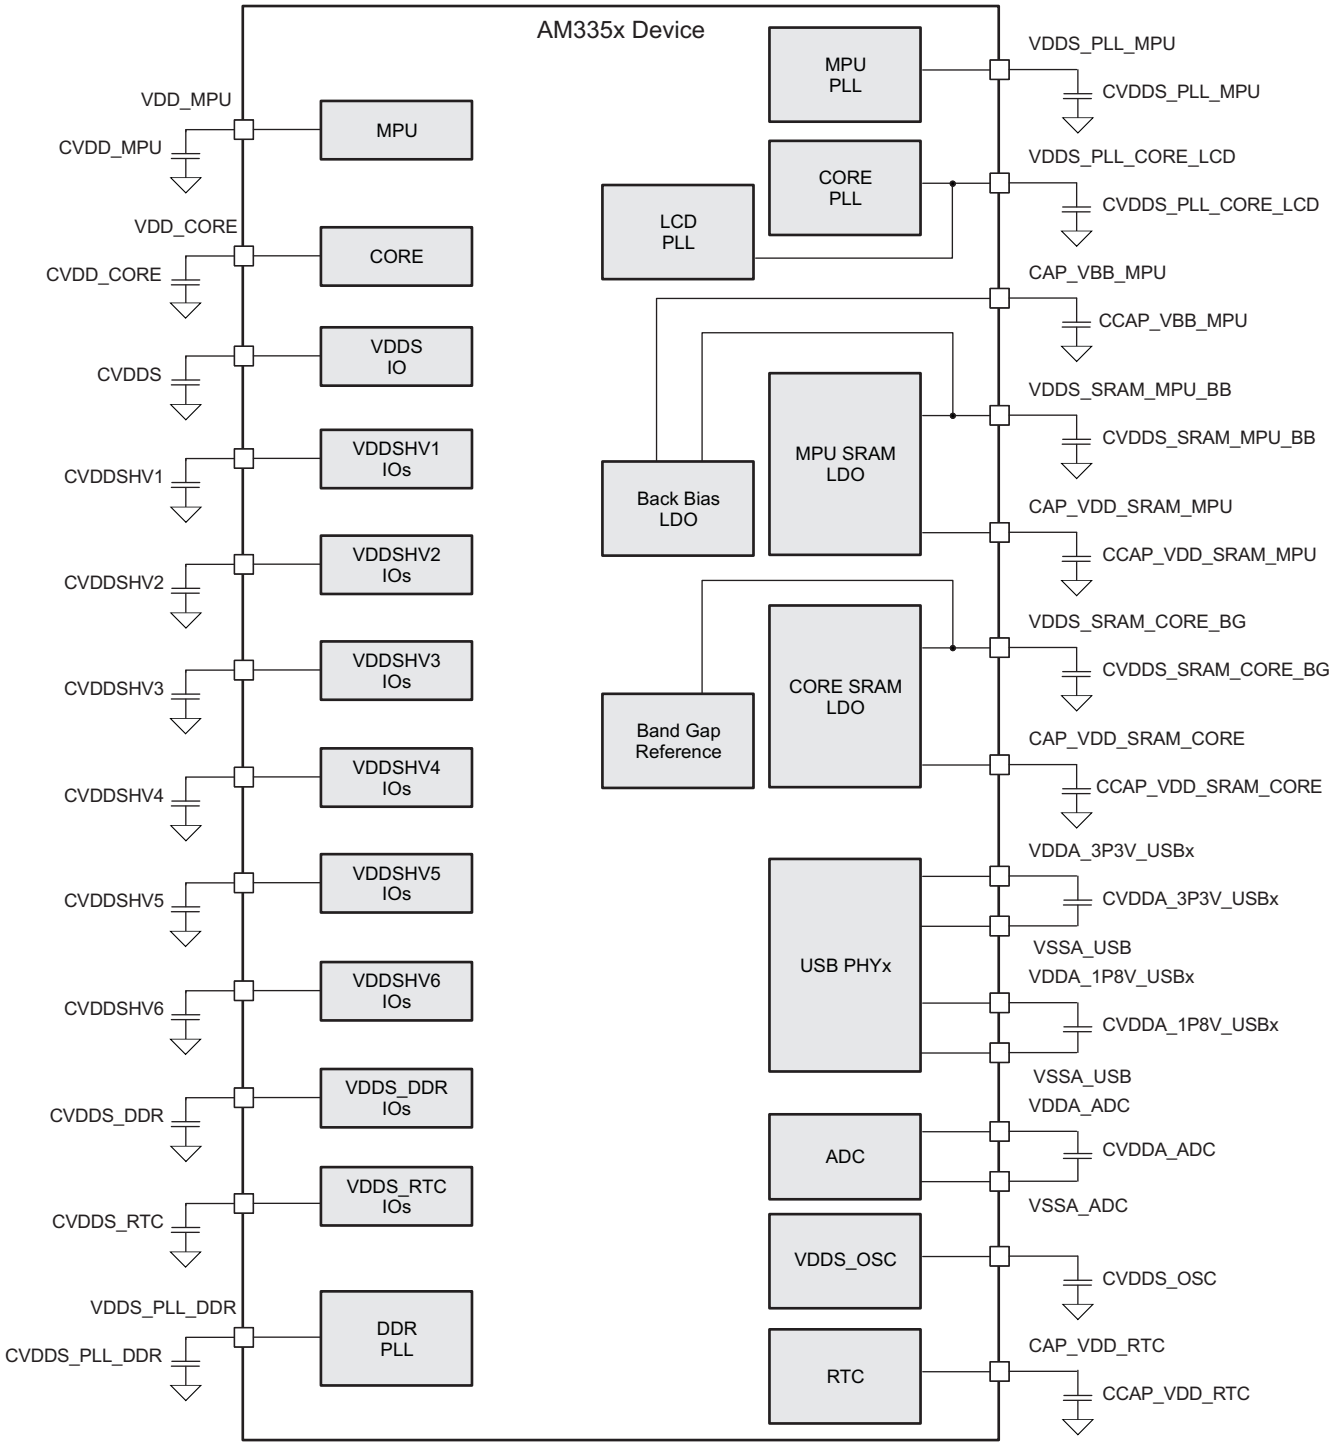
$C_{CAP\_VDD\_RTC}$ (1)(2)	1	µF
$C_{CAP\_VDD\_SRAM\_MPU}$ (1)	1	µF
$C_{CAP\_VBB\_MPU}$ (1)	1	µF

(1) LDO regulator outputs should not be used as a power source for any external components.

(2) The CAP_VDD_RTC terminal operates as an input to the RTC core voltage domain when the RTC_KLDO_ENn terminal is high.

图 5-1 shows an example of the external capacitors.



A. Decoupling capacitors must be placed as closed as possible to the power terminal. Choose the ground located closest to the power pin for each decoupling capacitor. In case of interconnecting powers, first insert the decoupling capacitor and then interconnect the powers.

B. The decoupling capacitor value depends on the board characteristics.

5.10 Touch Screen Controller and Analog-to-Digital Subsystem Electrical Parameters

The touch screen controller (TSC) and analog-to-digital converter (ADC) subsystem (TSC_ADC) is an 8-channel general-purpose ADC with optional support for interleaving TSC conversions for 4-wire, 5-wire, or 8-wire resistive panels. The TSC_ADC subsystem can be configured for use in one of the following applications:

- 8 general-purpose ADC channels
- 4-wire TSC with 4 general-purpose ADC channels
- 5-wire TSC with 3 general-purpose ADC channels
- 8-wire TSC.

表 5-14 summarizes the TSC_ADC subsystem electrical parameters.

(2) This parameter is valid when the respective AIN terminal is configured to operate as a general-purpose ADC input.

6 Power and Clocking

6.1 Power Supplies

6.1.1 Power Supply Slew Rate Requirement

To maintain the safe operating range of the internal ESD protection devices, it is recommended to limit the maximum slew rate for powering on the supplies to be less than 1.0E +5 V/s. For instance, as shown in 图 6-1, TI recommends to have the supply ramp slew for a 1.8-V supply be greater than 18 µs.

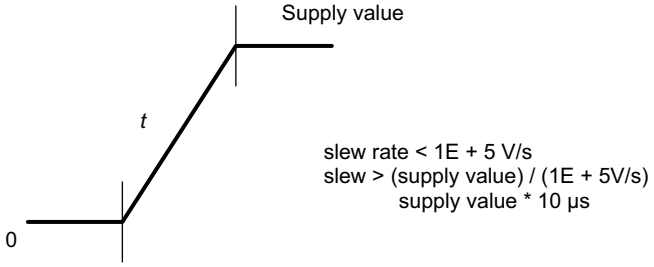

图 **6-1. Power Supply Slew and Slew Rate**

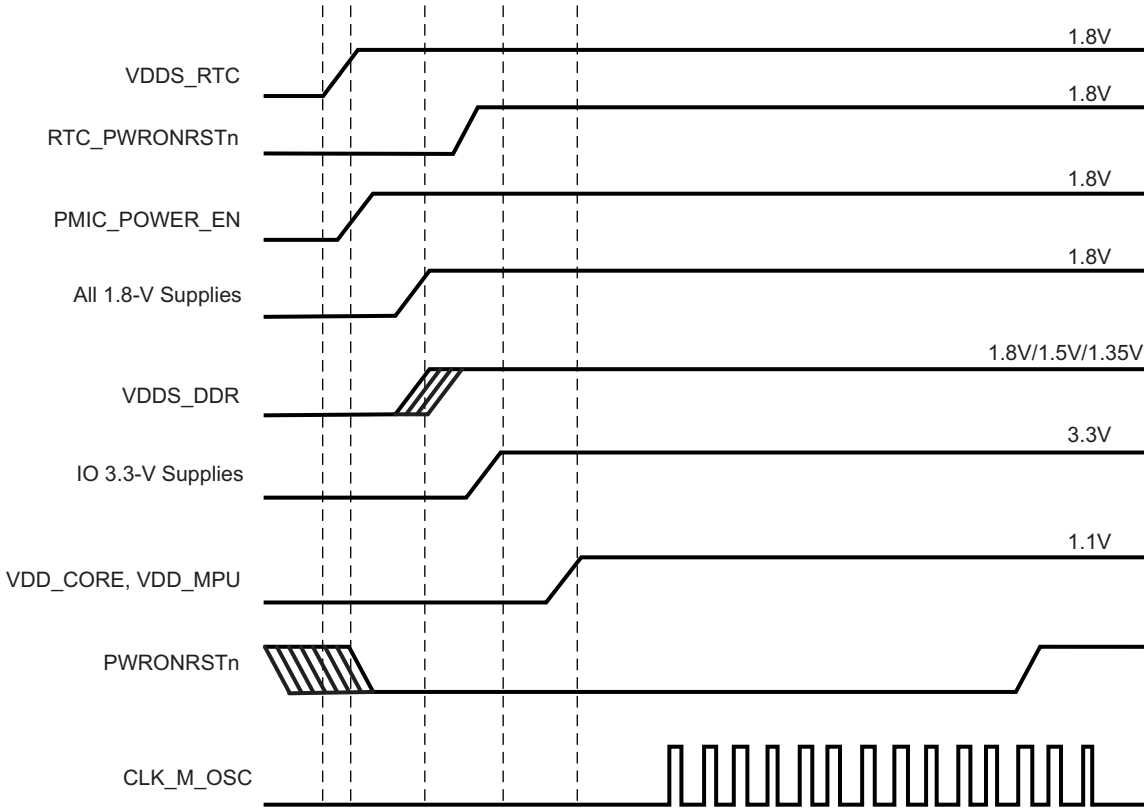


A. RTC_PWRONRSTn should be asserted for at least 1 ms to provide enough time for the internal RTC LDO output to reach a valid level before RTC reset is released.

B. When using the GCZ package option, VDD_MPU and VDD_CORE power inputs may be powered from the same source if the application only uses operating performance points (OPPs) that define a common power supply voltage for VDD_MPU and VDD_CORE.

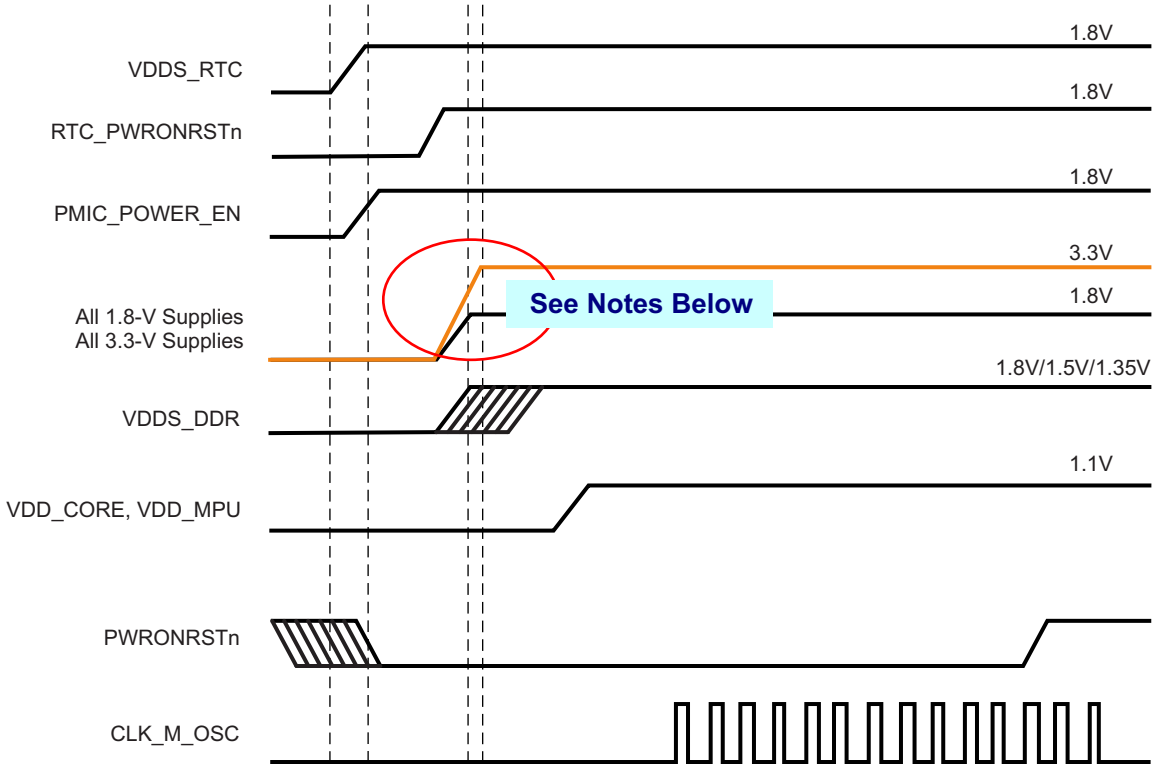
C. If a USB port is not used, the respective VDDA1P8V_USB terminal may be connected to any 1.8-V power supply and the respective VDDA3P3V_USB terminal may be connected to any 3.3-V power supply. If the system does not have a 3.3-V power supply, the VDDA3P3V_USB terminal may be connected to ground.

D. If the system uses mDDR or DDR2 memory devices, VDDS_DDR can be ramped simultaneously with the other 1.8-V IO power supplies.

E. VDDS_RTC can be ramped independent of other power supplies if PMIC_POWER_EN functionality is not required. If VDDS_RTC is ramped after VDD_CORE, there might be a small amount of additional leakage current on VDD_CORE. The power sequence shown provides the lowest leakage option.

F. To configure VDDSHVx [1-6] as 1.8 V, power up the respective VDDSHVx [1-6] to 1.8 V following the recommended sequence. To configure VDDSHVx [1-6] as 3.3 V, power up the respective VDDSHVx [1-6] to 3.3 V following the recommended sequence.

图 6-2. Preferred Power-Supply Sequencing With Dual-Voltage IOs Configured as 3.3 V



A. RTC_PWRONRSTn should be asserted for at least 1 ms to provide enough time for the internal RTC LDO output to reach a valid level before RTC reset is released.

B. The 3.3-V IO power supplies may be ramped simultaneously with the 1.8-V IO power supplies if the voltage sourced by any 3.3-V power supplies does not exceed the voltage sourced by any 1.8-V power supply by more than 2 V. Serious reliability issues may occur if the system power supply design allows any 3.3-V IO power supplies to exceed any 1.8-V IO power supplies by more than 2 V.

C. When using the GCZ package option, VDD_MPU and VDD_CORE power inputs may be powered from the same source if the application only uses operating performance points (OPPs) that define a common power supply voltage for VDD_MPU and VDD_CORE.

D. If a USB port is not used, the respective VDDA1P8V_USB terminal may be connected to any 1.8-V power supply and the respective VDDA3P3V_USB terminal may be connected to any 3.3-V power supply. If the system does not have a 3.3-V power supply, the VDDA3P3V_USB terminal may be connected to ground.

E. If the system uses mDDR or DDR2 memory devices, VDDS_DDR can be ramped simultaneously with the other 1.8-V IO power supplies.

F. VDDS_RTC can be ramped independent of other power supplies if PMIC_POWER_EN functionality is not required. If VDDS_RTC is ramped after VDD_CORE, there might be a small amount of additional leakage current on VDD_CORE. The power sequence shown provides the lowest leakage option.

G. To configure VDDSHVx [1-6] as 1.8 V, power up the respective VDDSHVx [1-6] to 1.8 V following the recommended sequence. To configure VDDSHVx [1-6] as 3.3 V, power up the respective VDDSHVx [1-6] to 3.3 V following the recommended sequence.

A. RTC_PWRONRSTn should be asserted for at least 1 ms to provide enough time for the internal RTC LDO output to reach a valid level before RTC reset is released.

B. When using the GCZ package option, VDD_MPU and VDD_CORE power inputs may be powered from the same source if the application only uses operating performance points (OPPs) that define a common power supply voltage for VDD_MPU and VDD_CORE.

C. If a USB port is not used, the respective VDDA1P8V_USB terminal may be connected to any 1.8-V power supply and the respective VDDA3P3V_USB terminal may be connected to any 3.3-V power supply. If the system does not have a 3.3-V power supply, the VDDA3P3V_USB terminal may be connected to ground.

A. RTC_PWRONRSTn should be asserted for at least 1 ms to provide enough time for the internal RTC LDO output to reach a valid level before RTC reset is released.

B. The CAP_VDD_RTC terminal operates as an input to the RTC core voltage domain when the internal RTC LDO is disabled by connecting the RTC_KALDO_ENn terminal to VDDS_RTC. If the internal RTC LDO is disabled, CAP_VDD_RTC should be sourced from an external 1.1-V power supply.

C. When using the GCZ package option, VDD_MPU and VDD_CORE power inputs may be powered from the same source if the application only uses operating performance points (OPPs) that define a common power supply voltage for VDD_MPU and VDD_CORE.

图 6-6. Power-Supply Sequencing with RTC Feature Disabled

6.1.2 Power-Down Sequencing

PWRONRSTn input terminal should be taken low, which stops all internal clocks before power supplies are turned off. All other external clocks to the device should be shut off.

The preferred way to sequence power down is to have all the power supplies ramped down sequentially in the exact reverse order of the power-up sequencing. In other words, the power supply that has been ramped up first should be the last one that should be ramped down. This ensures there would be no spurious current paths during the power-down sequence. The VDDS power supply must ramp down after all 3.3-V VDDSHVx [1-6] power supplies.

If it is desired to ramp down VDDS and VDDSHVx [1-6] simultaneously, it should always be ensured that the difference between VDDS and VDDSHVx [1-6] during the entire power-down sequence is <2 V. Any violation of this could cause reliability risks for the device. Further, it is recommended to maintain VDDS ≥1.5V as all the other supplies fully ramp down to minimize in-rush currents.

If none of the VDDSHVx [1-6] power supplies are configured as 3.3 V, the VDDS power supply may ramp down along with the VDDSHVx [1-6] supplies or after all the VDDSHVx [1-6] supplies have ramped down. It is recommended to maintain VDDS ≥1.5V as all the other supplies fully ramp down to minimize in-rush currents.

6.2 Clock Specifications

6.2.1 Input Clock Specifications

The AM3358-EP device has two clock inputs. Each clock input passes through an internal oscillator which can be connected to an external crystal circuit (oscillator mode) or external LVCMOS square-wave digital clock source (bypass mode). The oscillators automatically operate in bypass mode when their input is connected to an external LVCMOS square-wave digital clock source. The oscillator associated with a specific clock input must be enabled when the clock input is being used in either oscillator mode or bypass mode.

The OSC1 oscillator provides a 32.768-kHz reference clock to the real-time clock (RTC) and is connected to the RTC_XTALIN and RTC_XTALOUT terminals. This clock source is referred to as the 32K oscillator (CLK_32K_RTC) in the *AM335x Sitara Processors Technical Reference Manual* (SPRUH73). OSC1 is disabled by default after power is applied. This clock input is optional and may not be required if the RTC is configured to receive a clock from the internal 32k RC oscillator (CLK_RC32K) or peripheral PLL (CLK_32KHZ) which receives a reference clock from the OSC0 input.

The OSC0 oscillator provides a 19.2-MHz, 24-MHz, 25-MHz, or 26-MHz reference clock which is used to clock all non-RTC functions and is connected to the XTALIN and XTALOUT terminals. This clock source is referred to as the master oscillator (CLK_M_OSC) in the *AM335x Sitara Processors Technical Reference Manual* (SPRUH73). OSC0 is enabled by default after power is applied.

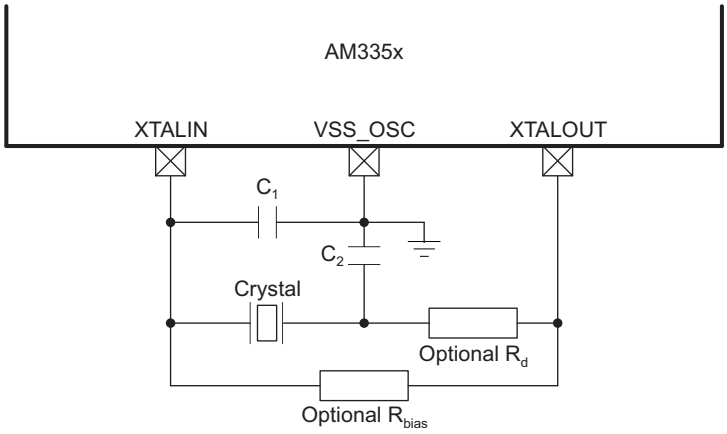
For more information related to recommended circuit topologies and crystal oscillator circuit requirements for these clock inputs, see 节 6.2.2.

6.2.2 Input Clock Requirements

6.2.2.1 OSC0 Internal Oscillator Clock Source

图 6-9 shows the recommended crystal circuit. It is recommended that pre-production printed circuit board (PCB) designs include the two optional resistors R_{bias} and R_d in case they are required for proper oscillator operation when combined with production crystal circuit components. In most cases, R_{bias} is not required and R_d is a 0-Ω resistor. These resistors may be removed from production PCB designs after evaluating oscillator performance with production crystal circuit components installed on pre-production PCBs.

The XTALIN terminal has a 15- to 40-kΩ internal pulldown resistor which is enabled when OSC0 is disabled. This internal resistor prevents the XTALIN terminal from floating to an invalid logic level which may increase leakage current through the oscillator input buffer.



A. Oscillator components (Crystal, C_1, C_2, optional R_{bias} and R_d) must be located close to the AM3358-EP package. Parasitic capacitance to the VSS_OSC and respective crystal circuit component grounds should be connected directly to the nearest PCB digital ground (VSS).

B. C_1 and C_2 represent the total capacitance of the respective PCB trace, load capacitor, and other components (excluding the crystal) connected to each crystal terminal. The value of capacitors C_1 and C_2 should be selected to provide the total load capacitance, C_L, specified by the crystal manufacturer. The total load capacitance is $C_L = [(C_1 \times C_2) / (C_1 + C_2)] + C_{shunt}$, where C_{shunt} is the crystal shunt capacitance (C_0) specified by the crystal manufacturer plus any mutual capacitance ($C_{pkg} + C_{PCB}$) seen across the AM3358-EP XTALIN and XTALOUT signals. For recommended values of crystal circuit components, see 表 6-2.

6.2.2.2 OSC0 LVCMOS Digital Clock Source

图 6-11 shows the recommended oscillator connections when OSC0 is connected to an LVCMOS square-wave digital clock source. The LVCMOS clock source is connected to the XTALIN terminal. The ground for the LVCMOS clock source and VSS_OSC should be connected directly to the nearest PCB digital ground (VSS). In this mode of operation, the XTALOUT terminal should not be used to source any external components. The printed circuit board design should provide a mechanism to disconnect the XTALOUT terminal from any external components or signal traces that may couple noise into OSC0 via the XTALOUT terminal.

The XTALIN terminal has a 15- to 40-kΩ internal pulldown resistor which is enabled when OSC0 is disabled. This internal resistor prevents the XTALIN terminal from floating to an invalid logic level which may increase leakage current through the oscillator input buffer.

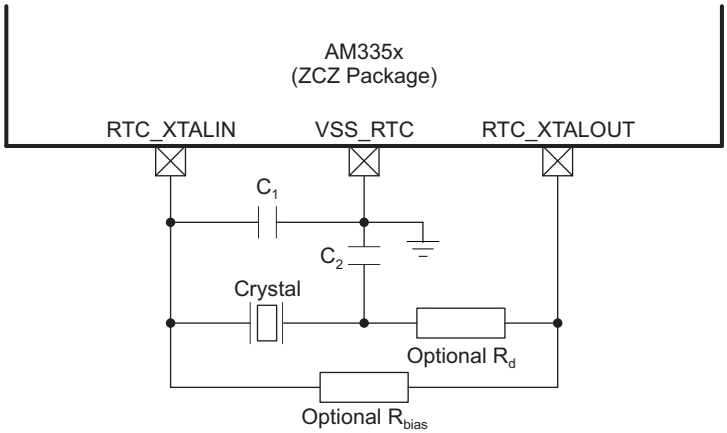
6.2.2.3 OSC1 Internal Oscillator Clock Source

图 6-12 shows the recommended crystal circuit for OSC1 of the GCZ package. It is recommended that pre-production printed circuit board (PCB) designs include the two optional resistors R_{bias} and R_d in case they are required for proper oscillator operation when combined with production crystal circuit components. In most cases, R_{bias} is not required and R_d is a 0-Ω resistor. These resistors may be removed from production PCB designs after evaluating oscillator performance with production crystal circuit components installed on pre-production PCBs.

The RTC_XTALIN terminal has a 10- to 40-kΩ internal pullup resistor which is enabled when OSC1 is disabled. This internal resistor prevents the RTC_XTALIN terminal from floating to an invalid logic level which may increase leakage current through the oscillator input buffer.



A. Oscillator components (Crystal, C_1, C_2, optional R_{bias} and R_d) must be located close to the AM3358-EP package. Parasitic capacitance to the printed circuit board (PCB) ground and other signals should be minimized to reduce noise coupled into the oscillator. VSS_RTC and respective crystal circuit component grounds should be connected directly to the nearest PCB digital ground (VSS).

B. C_1 and C_2 represent the total capacitance of the respective PCB trace, load capacitor, and other components (excluding the crystal) connected to each crystal terminal. The value of capacitors C_1 and C_2 should be selected to provide the total load capacitance, C_L, specified by the crystal manufacturer. The total load capacitance is $C_L = [(C_1 \times C_2) / (C_1 + C_2)] + C_{shunt}$, where C_{shunt} is the crystal shunt capacitance (C_0) specified by the crystal manufacturer plus any mutual capacitance ($C_{pkg} + C_{PCB}$) seen across the AM3358-EP RTC_XTALIN and RTC_XTALOUT signals. 6.2.2.4 OSC1 LVCMOS Digital Clock Source

图 6-14 shows the recommended oscillator connections when OSC1 of the GCZ package is connected to an LVCMOS square-wave digital clock source. The LVCMOS clock source is connected to the RTC_XTALIN terminal. The ground for the LVCMOS clock source and VSS_RTC of the GCZ package should be connected directly to the nearest PCB digital ground (VSS). In this mode of operation, the RTC_XTALOUT terminal should not be used to source any external components. 6.2.2.5 OSC1 Not Used

图 6-15 shows the recommended oscillator connections when OSC1 of the GCZ package is not used. An internal 10 kΩ pull-up on the RTC_XTALIN terminal is turned on when OSC1 is disabled to prevent this input from floating to an invalid logic level which may increase leakage current through the oscillator input buffer. OSC1 is disabled by default after power is applied. Therefore, both RTC_XTALIN and RTC_XTALOUT terminals should be a no connect (NC) when OSC1 is not used.

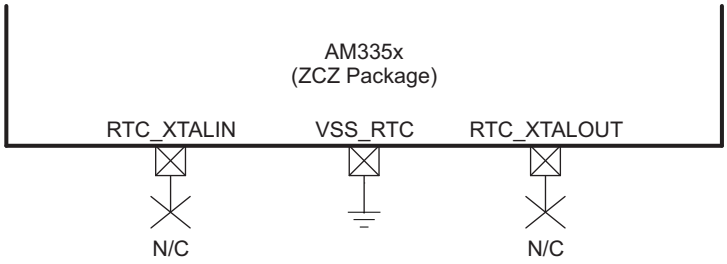

图 **6-15. OSC1 Not Used Schematic**

6.2.3 Output Clock Specifications

The AM3358-EP device has two clock output signals. The CLKOUT1 signal is always a replica of the OSC0 input clock which is referred to as the master oscillator (CLK_M_OSC) in the *AM335x Sitara Processors Technical Reference Manual* (SPRUH73). The CLKOUT2 signal can be configured to output the OSC1 input clock, which is referred to as the 32K oscillator (CLK_32K_RTC) in the *AM335x Sitara Processors Technical Reference Manual* (SPRUH73), or four other internal clocks. For more information related to configuring these clock output signals, see the *CLKOUT Signals* section of the *AM335x Sitara Processors Technical Reference Manual* (SPRUH73).

6.2.4 Output Clock Characteristics

注

The AM3358-EP CLKOUT1 and CLKOUT2 clock outputs should not be used as a synchronous clock for any of the peripheral interfaces because they were not timing closed to any other signals. These clock outputs also were not designed to source any time critical external circuits that require a low jitter reference clock. The jitter performance of these outputs is unpredictable due to complex combinations of many system variables. For example, CLKOUT2 may be sourced from several PLLs with each PLL supporting many configurations that yield different jitter performance. There are also other unpredictable contributors to jitter performance such as application specific noise or crosstalk into the clock circuits. Therefore, there are no plans to specify jitter performance for these outputs.

6.2.4.1 CLKOUT1

The CLKOUT1 signal can be output on the XDMA_EVENT_INTR0 terminal. This terminal connects to one of seven internal signals via configurable multiplexers. The XDMA_EVENT_INTR0 multiplexer must be configured for Mode 3 to connect the CLKOUT1 signal to the XDMA_EVENT_INTR0 terminal.

The default reset configuration of the XDMA_EVENT_INTR0 multiplexer is selected by the logic level applied to the LCD_DATA5 terminal on the rising edge of PWRONRSTn. The XDMA_EVENT_INTR0 multiplexer is configured to Mode 7 if the LCD_DATA5 terminal is low on the rising edge of PWRONRSTn or Mode 3 if the LCD_DATA5 terminal is high on the rising edge of PWRONRSTn. This allows the CLKOUT1 signal to be output on the XDMA_EVENT_INTR0 terminal without software intervention. In this mode, the output is held low while PWRONRSTn is active and begins to toggle after PWRONRSTn is released.

6.2.4.2 CLKOUT2

The CLKOUT2 signal can be output on the XDMA_EVENT_INTR1 terminal. This terminal connects to one of seven internal signals via configurable multiplexers. The XDMA_EVENT_INTR1 multiplexer must be configured for Mode 3 to connect the CLKOUT2 signal to the XDMA_EVENT_INTR1 terminal.

The default reset configuration of the XDMA_EVENT_INTR1 multiplexer is always Mode 7. Software must configure the XDMA_EVENT_INTR1 multiplexer to Mode 3 for the CLKOUT2 signal to be output on the XDMA_EVENT_INTR1 terminal.

7 Peripheral Information and Timings

The AM3358-EP device contains many peripheral interfaces. In order to reduce package size and lower overall system cost while maintaining maximum functionality, many of the AM3358-EP terminals can multiplex up to eight signal functions. Although there are many combinations of pin multiplexing that are possible, only a certain number of sets, called IO Sets, are valid due to timing limitations. These valid IO Sets were carefully chosen to provide many possible application scenarios for the user.

Texas Instruments has developed a Windows-based application called Pin Mux Utility that helps a system designer select the appropriate pin-multiplexing configuration for their AM3358-EP-based product design. The Pin Mux Utility provides a way to select valid IO Sets of specific peripheral interfaces to ensure the pin-multiplexing configuration selected for a design only uses valid IO Sets supported by the AM3358-EP device.

7.1 Parameter Information

The data provided in the following Timing Requirements and Switching Characteristics tables assumes the device is operating within the Recommended Operating Conditions defined in 节 5, unless otherwise noted.

7.1.1 Timing Parameters and Board Routing Analysis

The timing parameter values specified in this data manual do *not* include delays by board routings. As a good board design practice, such delays must *always* be taken into account. Timing values may be adjusted by increasing or decreasing such delays. TI recommends utilizing the available IO buffer information specification (IBIS) models to analyze the timing characteristics correctly. If needed, external logic hardware such as buffers may be used to compensate any timing differences.

The timing parameter values specified in this data manual assume the SLEWCTRL bit in each pad control register is configured for fast mode (0b).

For the mDDR(LPDDR), DDR2, DDR3, DDR3L memory interface, it is *not* necessary to use the IBIS models to analyze timing characteristics. TI provides a PCB routing rules solution that describes the routing rules to ensure the mDDR(LPDDR), DDR2, DDR3, DDR3L memory interface timings are met.

7.2 Recommended Clock and Control Signal Transition Behavior

All clocks and control signals ***must*** transition between V_{IH} and V_{IL} (or between V_{IL} and V_{IH}) in a monotonic manner.

7.3 OPP50 Support

Some peripherals and features have limited support when the device is operating in OPP50. Below is a complete list of these limitations.

Not supported when operating in OPP50:

- CPSW
- DDR3
- DEBUGSS-Trace
- GPMC Asynchronous Mode
- LCDC LIDD Mode
- MDIO
- PRU-ICSS MII

Reduced performance when operating in OPP50:

- DDR2
- DEBUGSS-JTAG
- GPMC Synchronous Mode
- LCDC Raster Mode
- LPDDR
- McASP
- McSPI
- MMCSD

7.6 Ethernet Media Access Controller (EMAC) and Switch

7.6.1 EMAC and Switch Electrical Data and Timing

The EMAC and Switch implemented in the AM3358-EP device supports GMII mode, but the AM3358-EP design does not pin out 9 of the 24 GMII signals. This was done to reduce the total number of package terminals. Therefore, the AM3358-EP device does not support GMII mode. MII mode is supported with the remaining GMII signals.

The *AM335x Sitara Processors Technical Reference Manual* (SPRUH73) and this document may reference internal signal names when discussing peripheral input and output signals since many of the AM3358-EP package terminals can be multiplexed to one of several peripheral signals. For example, the AM3358-EP terminal names for port 1 of the EMAC and switch have been changed from GMII to MII to indicate their Mode 0 function, but the internal signal is named GMII. However, documents that describe the Ethernet switch reference these signals by their internal signal name. For a cross-reference of internal signal names to terminal names, see Table 4-1.

Operation of the EMAC and switch is not supported for OPP50.

A. RGMII[x]_RCLK must be externally delayed relative to the RGMII[x]_RD[3:0] and RGMII[x]_RCTL signals to meet the respective timing requirements.

B. Data and control information is received using both edges of the clocks. RGMII[x]_RD[3:0] carries data bits 3-0 on the rising edge of RGMII[x]_RCLK and data bits 7-4 on the falling edge of RGMII[x]_RCLK. Similarly, RGMII[x]_RCTL carries RXDV on rising edge of RGMII[x]_RCLK and RXERR on falling edge of RGMII[x]_RCLK.

A. The EMAC and switch implemented in the AM3358-EP device supports internal delay mode, but timing closure was not performed for this mode of operation. Therefore, the AM3358-EP device does not support internal delay mode.

B. Data and control information is transmitted using both edges of the clocks. RGMII[x]_TD[3:0] carries data bits 3-0 on the rising edge of RGMII[x]_TCLK and data bits 7-4 on the falling edge of RGMII[x]_TCLK. Similarly, RGMII[x]_TCTL carries TXEN on rising edge of RGMII[x]_TCLK and TXERR of falling edge of RGMII[x]_TCLK.

7.7 External Memory Interfaces

The device includes the following external memory interfaces:

- General-purpose memory controller (GPMC)
- DDR2, DDR3, DDR3L Memory Interface (EMIF)

7.7.1 General-Purpose Memory Controller (GPMC)

注

For more information, see the Memory Subsystem and General-Purpose Memory Controller section of the *AM335x Sitara Processors Technical Reference Manual* (SPRUH73).

The GPMC is the unified memory controller used to interface external memory devices such as:

- Asynchronous SRAM-like memories and ASIC devices
- Asynchronous page mode and synchronous burst NOR flash
- NAND flash

(1) The FA5 parameter shows the amount of time required to internally sample input data. It is expressed in number of GPMC functional clock cycles. From start of read cycle and after FA5 functional clock cycles, input data is internally sampled by active functional clock edge. FA5 value must be stored inside the AccessTime register bit field.

(2) The FA20 parameter shows amount of time required to internally sample successive input page data. It is expressed in number of GPMC functional clock cycles. After each access to input page data, next input page data is internally sampled by active functional clock edge after FA20 functional clock cycles. The FA20 value must be stored in the PageBurstAccessTime register bit field.

(3) The FA21 parameter shows amount of time required to internally sample first input page data. It is expressed in number of GPMC functional clock cycles. From start of read cycle and after FA21 functional clock cycles, first input page data is internally sampled by active functional clock edge. FA21 value must be stored inside the AccessTime register bit field.

(4) P = PageBurstAccessTime × (TimeParaGranularity + 1) × GPMC_FCLK[6]

(5) H = AccessTime × (TimeParaGranularity + 1) × GPMC_FCLK[6]

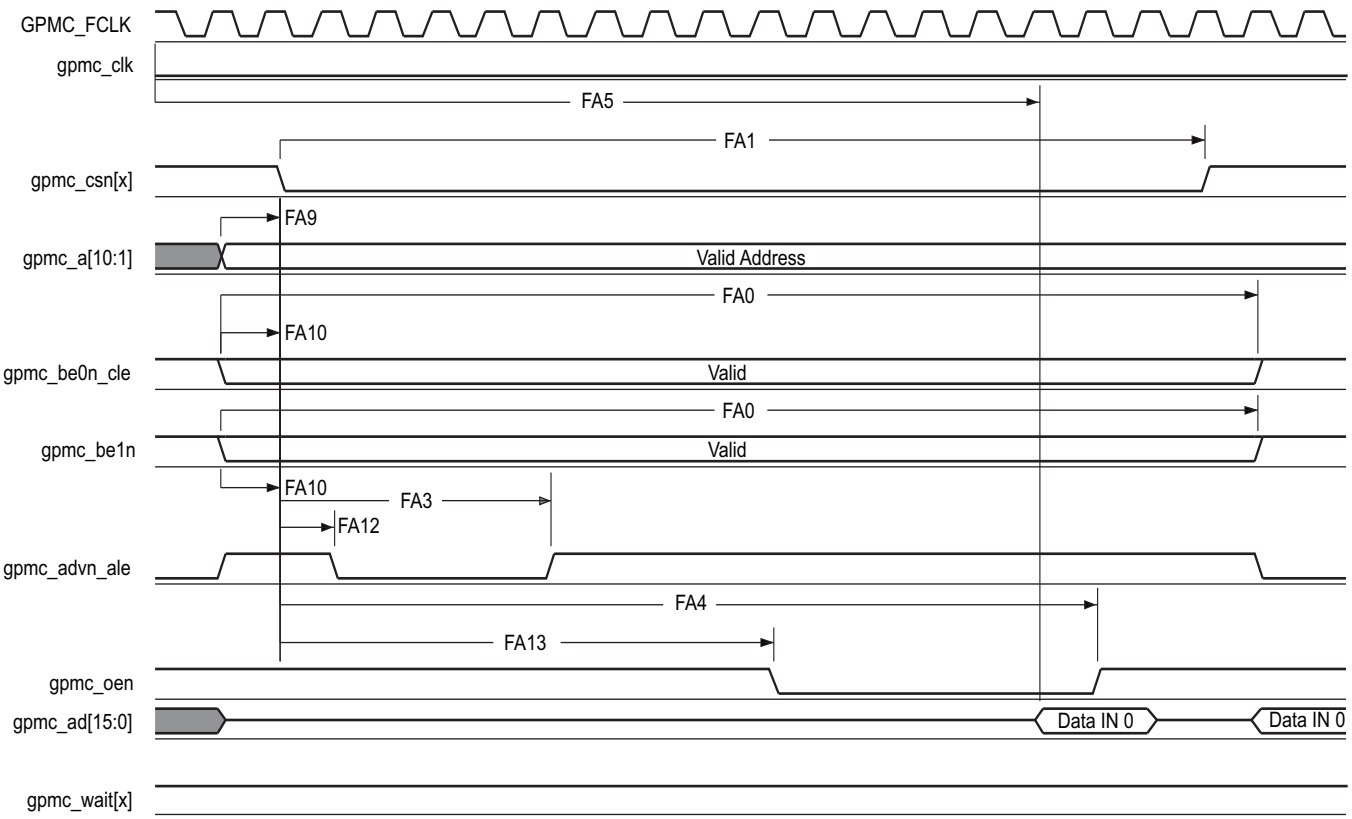
(14) GPMC_FCLK is general-purpose memory controller internal functional clock period in ns.



A. In gpmc_csn[x], x is equal to 0, 1, 2, 3, 4, or 5. In gpmc_wait[x], x is equal to 0 or 1.

B. FA5 parameter illustrates amount of time required to internally sample input data. It is expressed in number of GPMC functional clock cycles. From start of read cycle and after FA5 functional clock cycles, input data will be internally sampled by active functional clock edge. FA5 value must be stored inside AccessTime register bits field.

C. GPMC_FCLK is an internal clock (GPMC functional clock) not provided externally.

B. FA21 parameter illustrates amount of time required to internally sample first input page data. It is expressed in number of GPMC functional clock cycles. From start of read cycle and after FA21 functional clock cycles, first input page data will be internally sampled by active functional clock edge. FA21 calculation must be stored inside AccessTime register bits field.

C. FA20 parameter illustrates amount of time required to internally sample successive input page data. It is expressed in number of GPMC functional clock cycles. After each access to input page data, next input page data will be internally sampled by active functional clock edge after FA20 functional clock cycles. FA20 is also the duration of address phases for successive input page data (excluding first input page data). FA20 value must be stored in PageBurstAccessTime register bits field.

7.7.2 mDDR(LPDDR), DDR2, DDR3, DDR3L Memory Interface

The device has a dedicated interface to mDDR(LPDDR), DDR2, DDR3, and DDR3L SDRAM. It supports JEDEC standard compliant mDDR(LPDDR), DDR2, DDR3, and DDR3L SDRAM devices with a 16-bit data path to external SDRAM memory.

For more details on the mDDR(LPDDR), DDR2, DDR3, and DDR3L memory interface, see the EMIF section of the *AM335x Sitara Processors Technical Reference Manual* (SPRUH73).

7.7.2.1 mDDR (LPDDR) Routing Guidelines

It is common to find industry references to mobile double data rate (mDDR) when discussing JEDEC defined low-power double-data rate (LPDDR) memory devices. The following guidelines use LPDDR when referencing JEDEC defined low-power double-data rate memory devices.

7.7.2.1.1 Board Designs

TI only supports board designs that follow the guidelines outlined in this document. The switching characteristics and the timing diagram for the LPDDR memory interface are shown in 表 7-32 and 图 7-32.

(1) The JEDEC JESD209B specification only defines the maximum clock period for LPDDR333 and faster speed bin LPDDR memory devices. To determine the maximum clock period, see the respective LPDDR memory data sheet.

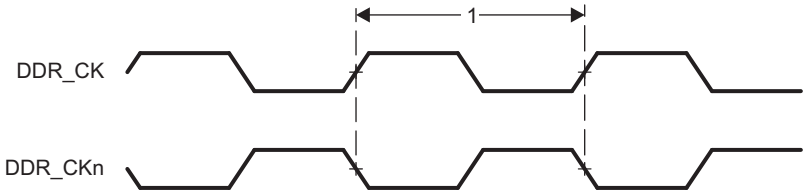

图 7-32. LPDDR Memory Interface Clock Timing

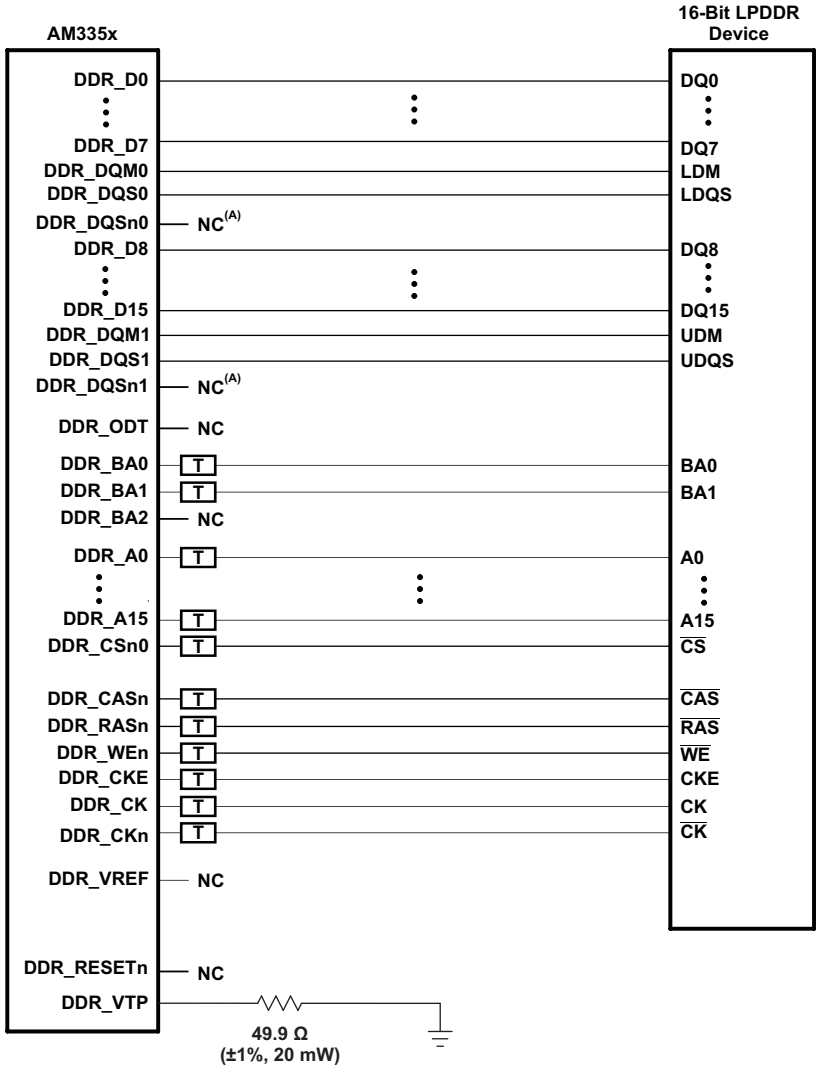
7.7.2.1.2 LPDDR Interface

This section provides the timing specification for the LPDDR interface as a PCB design and manufacturing specification. The design rules constrain PCB trace length, PCB trace skew, signal integrity, cross-talk, and signal timing. These rules, when followed, result in a reliable LPDDR memory system without the need for a complex timing closure process. For more information regarding the guidelines for using this LPDDR specification, see the *Understanding TI's PCB Routing Rule-Based DDR Timing Specification* application report (SPRAAV0). This application report provides generic guidelines and approach. All the specifications provided in the data manual take precedence over the generic guidelines and must be adhered to for a reliable LPDDR interface operation.

7.7.2.1.2.1 LPDDR Interface Schematic

图 7-33 shows the schematic connections for 16-bit interface on AM3358-EP device using one x16 LPDDR device. The AM3358-EP LPDDR memory interface only supports 16-bit wide mode of operation. The AM3358-EP device can only source one load connected to the DQS[x] and DQ[x] net class signals and one load connected to the CK and ADDR_CTRL net class signals. For more information related to net classes, see 节 7.7.2.1.2.8.



A. Enable internal weak pulldown on these pins. For details, see the EMIF section of the *AM335x Sitara Processors Technical Reference Manual* (SPRUH73).

B. For all the termination requirements, see 节 7.7.2.1.2.9.

图 7-33. 16-Bit LPDDR Interface Using One 16-Bit LPDDR Device

7.7.2.1.2.2 Compatible JEDEC LPDDR Devices

表 7-33 shows the parameters of the JEDEC LPDDR devices that are compatible with this interface. Generally, the LPDDR interface is compatible with x16 LPDDR400 speed grade LPDDR devices.

表 7-33. Compatible JEDEC LPDDR Devices (Per Interface)(1)

NO.	PARAMETER	MIN	MAX	UNIT
1	JEDEC LPDDR device speed grade	LPDDR400		
2	JEDEC LPDDR device bit width	x16	x16	Bits
3	JEDEC LPDDR device count		1	Devices
4	JEDEC LPDDR device terminal count		60	Terminals

(1) If the LPDDR interface is operated with a clock frequency less than 200 MHz, lower-speed grade LPDDR devices may be used if the minimum clock period specified for the LPDDR device is less than or equal to the minimum clock period selected for the AM3358-EP LPDDR interface.

7.7.2.1.2.3 PCB Stackup

The minimum stackup required for routing the AM3358-EP device is a four-layer stackup as shown in 表 7-34. Additional layers may be added to the PCB stackup to accommodate other circuitry, enhance signal integrity and electromagnetic interference performance, or to reduce the size of the PCB footprint.

表 7-34. Minimum PCB Stackup(1)

LAYER	TYPE	DESCRIPTION
1	Signal	Top signal routing
2	Plane	Ground
3	Plane	Split Power Plane
4	Signal	Bottom signal routing

(1) All signals that have critical signal integrity requirements should be routed first on layer 1. It may not be possible to route all of these signals on layer 1 which requires some to be routed on layer 4. When this is done, the signal routes on layer 4 should not cross splits in the power plane.

Complete stackup specifications are provided in 表 7-35.

表 7-35. PCB Stackup Specifications(1)

NO.	PARAMETER	MIN	TYP	MAX	UNIT

11	Single-ended impedance, Zo(3)		50	75	Ω
12	Impedance control(4)(5)	Zo-5	Zo	Zo+5	Ω

(1) For the LPDDR device BGA pad size, see the LPDDR device manufacturer documentation.

(2) A 20-10 via may be used if enough power routing resources are available. An 18-10 via allows for more flexible power routing to the AM3358-EP device.

(3) Zo is the nominal singled-ended impedance selected for the PCB.

(4) This parameter specifies the AC characteristic impedance tolerance for each segment of a PCB signal trace relative to the chosen Zo defined by the single-ended impedance parameter.

(5) Tighter impedance control is required to ensure flight time skew is minimal.

7.7.2.1.2.4 Placement

图 7-34 shows the required placement for the LPDDR devices. The dimensions for this figure are defined in 表 7-36. The placement does not restrict the side of the PCB on which the devices are mounted. The ultimate purpose of the placement is to limit the maximum trace lengths and allow for proper routing space. For single-memory LPDDR systems, the second LPDDR device is omitted from the placement.

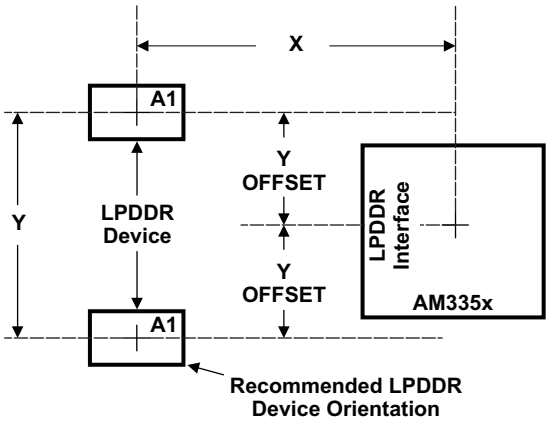

图 7-34. AM3358-EP Device and LPDDR Device Placement

表 7-36. Placement Specifications(1)

NO.	PARAMETER	MIN	MAX	UNIT
1	X(2)(3)		1750	mils
2	Y(2)(3)		1280	mils
3	Y Offset(2)(3)(4)		650	mils
4	Clearance from non-LPDDR signal to LPDDR keepout region(5)(6)	4		w

(1) LPDDR keepout region to encompass entire LPDDR routing area.

(2) For dimension definitions, see 图 7-34.

(3) Measurements from center of AM3358-EP device to center of LPDDR device.

(4) For single-memory systems, TI recommends that Y offset be as small as possible.

(5) w is defined as the signal trace width.

(6) Non-LPDDR signals allowed within LPDDR keepout region provided they are separated from LPDDR routing layers by a ground plane.

7.7.2.1.2.5 LPDDR Keepout Region

The region of the PCB used for the LPDDR circuitry must be isolated from other signals. The LPDDR keepout region is defined for this purpose and is shown in 图 7-35. This region should encompass all LPDDR circuitry and the region size varies with component placement and LPDDR routing. Additional clearances required for the keepout region are shown in 表 7-36. Non-LPDDR signals should not be routed on the same signal layer as LPDDR signals within the LPDDR keepout region. Non-LPDDR signals may be routed in the region provided they are routed on layers separated from LPDDR signal layers by a ground layer. No breaks should be allowed in the reference ground or VDDS_DDR power plane in this region. In addition, the VDDS_DDR power plane should cover the entire keepout region.

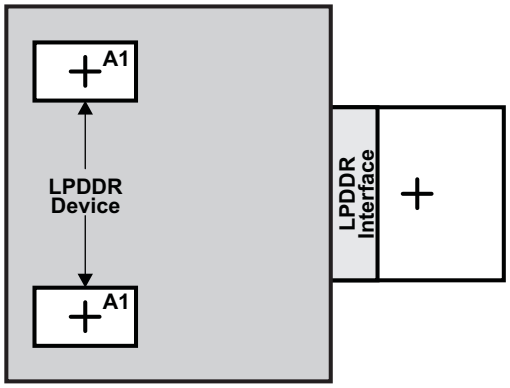

图 **7-35. LPDDR Keepout Region**

7.7.2.1.2.6 Bulk Bypass Capacitors

Bulk bypass capacitors are required for moderate speed bypassing of the LPDDR and other circuitry. 表 7-37 contains the minimum numbers and capacitance required for the bulk bypass capacitors. Note that this table only covers the bypass needs of the AM3358-EP LPDDR interface and LPDDR devices. Additional bulk bypass capacitance may be needed for other circuitry.

表 **7-37. Bulk Bypass Capacitors(1)**

NO.	PARAMETER	MIN	MAX	UNIT
1	AM3358-EP VDDS_DDR bulk bypass capacitor count	1		Devices
2	AM3358-EP VDDS_DDR bulk bypass total capacitance	10		µF
3	LPDDR#1 bulk bypass capacitor count	1		Devices
4	LPDDR#1 bulk bypass total capacitance	10		µF
5	LPDDR#2 bulk bypass capacitor count(2)	1		Devices
6	LPDDR#2 bulk bypass total capacitance(2)	10		µF

(1) These devices should be placed near the device they are bypassing, but preference should be given to the placement of the high-speed (HS) bypass capacitors.

(2) Only used when two LPDDR devices are used.

7.7.2.1.2.7 High-Speed Bypass Capacitors

High-speed (HS) bypass capacitors are critical for proper LPDDR interface operation. It is particularly important to minimize the parasitic series inductance of the HS bypass capacitors, AM3358-EP device LPDDR power, and AM3358-EP device LPDDR ground connections. 表 7-38 contains the specification for the HS bypass capacitors as well as for the power connections on the PCB.

表 **7-38. High-Speed Bypass Capacitors**

NO.	PARAMETER	MIN	MAX	UNIT
1	HS bypass capacitor package size(1)		0402	10 mils
2	Distance from HS bypass capacitor to device being bypassed		250	mils
3	Number of connection vias for each HS bypass capacitor(2)	2		Vias
4	Trace length from bypass capacitor contact to connection via		30	mils
5	Number of connection vias for each AM3358-EP VDDS_DDR and VSS terminal	1		Vias
6	Trace length from AM3358-EP VDDS_DDR and VSS terminal to connection via		35	mils
7	Number of connection vias for each LPDDR device power and ground terminal	1		Vias
8	Trace length from LPDDR device power and ground terminal to connection via		35	mils
9	AM3358-EP VDDS_DDR HS bypass capacitor count(3)	10		Devices
10	AM3358-EP VDDS_DDR HS bypass capacitor total capacitance	0.6		µF
11	LPDDR device HS bypass capacitor count(3)(4)	8		Devices
12	LPDDR device HS bypass capacitor total capacitance(4)	0.4		µF

(1) LxW, 10-mil units; for example, a 0402 is a 40x20-mil surface-mount capacitor.

(2) An additional HS bypass capacitor can share the connection vias only if it is mounted on the opposite side of the board.

(3) These devices should be placed as close as possible to the device being bypassed.

(4) Per LPDDR device.

7.7.2.1.2.8 Net Classes

表 7-39 lists the clock net classes for the LPDDR interface. 表 7-40 lists the signal net classes, and associated clock net classes, for the signals in the LPDDR interface. These net classes are used for the termination and routing rules that follow.

表 **7-39. Clock Net Class Definitions**

CLOCK NET CLASS	AM3358-EP PIN NAMES
CK	DDR_CK and DDR_CKn
DQS0	DDR_DQS0
DQS1	DDR_DQS1

表 **7-40. Signal Net Class Definitions**

SIGNAL NET CLASS	ASSOCIATED CLOCK NET CLASS	AM3358-EP PIN NAMES
ADDR_CTRL	CK	DDR_BA[1:0], DDR_A[15:0], DDR_CSn0, DDR_CASn, DDR_RASn, DDR_WEn, DDR_CKE
DQ0	DQS0	DDR_D[7:0], DDR_DQM0
DQ1	DQS1	DDR_D[15:8], DDR_DQM1

7.7.2.1.2.9 LPDDR Signal Termination

There is no specific need for adding terminations on the LPDDR interface. However, system designers may evaluate the need for serial terminators for EMI and overshoot reduction. Placement of serial terminations for DQS[x] and DQ[x] net class signals should be determined based on PCB analysis. Placement of serial terminations for ADDR_CTRL net class signals should be close to the AM3358-EP device. 表 7-41 shows the specifications for the serial terminators in such cases.

表 7-41. LPDDR Signal Terminations

NO.	PARAMETER	MIN	TYP	MAX	UNIT
1	CK net class(1)	0	22	Zo(2)	Ω
2	ADDR_CTRL net class(1)(3)(4)	0	22	Zo(2)	Ω
3	DQS0, DQS1, DQ0, and DQ1 net classes	0	22	Zo(2)	Ω

(1) Only series termination is permitted.

(2) Zo is the LPDDR PCB trace characteristic impedance.

(3) Series termination values larger than typical only recommended to address EMI issues.

(4) Series termination values should be uniform across net class.

7.7.2.1.3 LPDDR CK and ADDR_CTRL Routing

图 7-36 shows the topology of the routing for the CK and ADDR_CTRL net classes. The length of signal path AB and AC should be minimized with emphasis to minimize lengths C and D such that length A is the majority of the total length of signal path AB and AC.

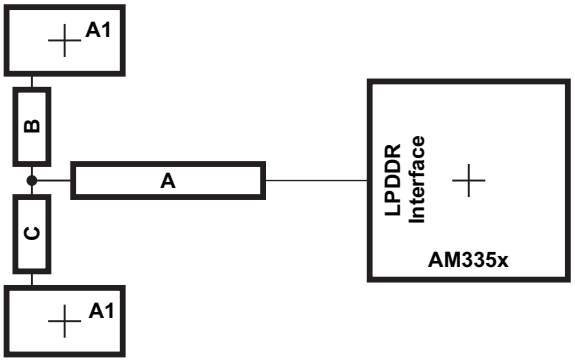

图 7-36. CK and ADDR_CTRL Routing and Topology

表 7-42. CK and ADDR_CTRL Routing Specification(1)(2)

NO.	PARAMETER	MIN	TYP	MAX	UNIT

7	ADDR_CTRL-to-ADDR_CTRL skew length mismatch			100	mils
8	Center-to-center ADDR_CTRL to other LPDDR trace spacing(4)	4w			
9	Center-to-center ADDR_CTRL to other ADDR_CTRL trace spacing(4)	3w			
10	ADDR_CTRL A-to-B and ADDR_CTRL A-to-C skew length mismatch(2)			100	mils
11	ADDR_CTRL B-to-C skew length mismatch			100	mils

(1) CK represents the clock net class, and ADDR_CTRL represents the address and control signal net class.

(2) Series terminator, if used, should be located closest to the AM3358-EP device.

(3) Differential impedance should be Zo x 2, where Zo is the single-ended impedance defined in 表 7-35.

(4) Center-to-center spacing is allowed to fall to minimum (w) for up to 500 mils of routed length to accommodate BGA escape and routing congestion.

(5) CACLM is the longest Manhattan distance of the CK and ADDR_CTRL net classes.

图 7-37 shows the topology and routing for the DQS[x] and DQ[x] net classes; the routes are point to point. Skew matching across bytes is not needed nor recommended.

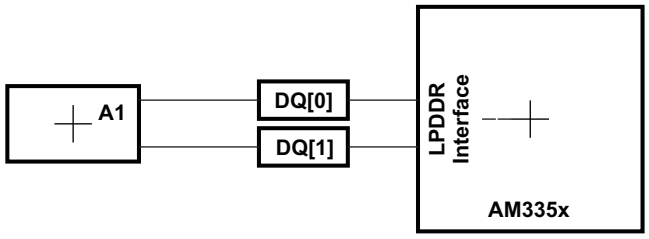

图 **7-37. DQS[x] and DQ[x] Routing and Topology**

表 **7-43. DQS[x] and DQ[x] Routing Specification(1)**

NO.	PARAMETER	MIN	TYP	MAX	UNIT
1	Center-to-center DQS[x] spacing			2w	
2	Center-to-center DDR_DQS[x] to other LPDDR trace spacing(2)	4w			
3	DQS[x] and DQ[x] nominal trace length(3)	DQLM-50	DQLM	DQLM+50	mils
4	DQ[x]-to-DQS[x] skew length mismatch(3)			100	mils
5	DQ[x]-to-DQ[x] skew length mismatch(3)			100	mils
6	Center-to-center DQ[x] to other LPDDR trace spacing(2)(4)	4w			
7	Center-to-center DQ[x] to other DQ[x] trace spacing(2)(5)	3w			

(1) DQS[x] represents the DQS0 and DQS1 clock net classes, and DQ[x] represents the DQ0 and DQ1 signal net classes.

(2) Center-to-center spacing is allowed to fall to minimum (w) for up to 500 mils of routed length to accommodate BGA escape and routing congestion.

(3) There is no requirement for skew matching between data bytes; that is, from net classes DQS0 and DQ0 to net classes DQS1 and DQ1.

(4) Signals from one DQ net class should be considered other LPDDR traces to another DQ net class.

(5) DQLM is the longest Manhattan distance of each of the DQS[x] and DQ[x] net classes.

7.7.2.2 DDR2 Routing Guidelines

7.7.2.2.1 Board Designs

TI only supports board designs that follow the guidelines outlined in this document. 表 7-44 and 图 7-38 show the switching characteristics and timing diagram for the DDR2 memory interface.

表 7-44. Switching Characteristics for DDR2 Memory Interface

NO.	PARAMETER		MIN	MAX	UNIT
1	$t_{c(DDR\_CK)}$ $t_{c(DDR\_CKn)}$	Cycle time, DDR_CK and DDR_CKn		8(1)	ns

(1) The JEDEC JESD79-2F specification defines the maximum clock period of 8 ns for all standard-speed bin DDR2 memory devices. Therefore, all standard-speed bin DDR2 memory devices are required to operate at 125 MHz.

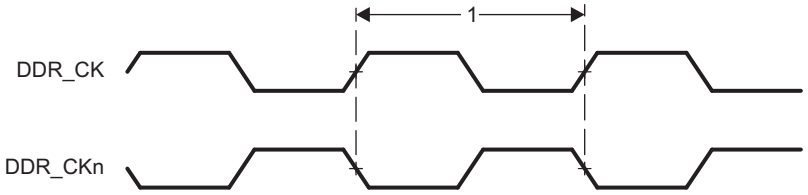

图 7-38. DDR2 Memory Interface Clock Timing

7.7.2.2.2 DDR2 Interface

This section provides the timing specification for the DDR2 interface as a PCB design and manufacturing specification. The design rules constrain PCB trace length, PCB trace skew, signal integrity, cross-talk, and signal timing. These rules, when followed, result in a reliable DDR2 memory system without the need for a complex timing closure process. For more information regarding the guidelines for using this DDR2 specification, see the *Understanding TI's PCB Routing Rule-Based DDR Timing Specification* application report (SPRAAV0). This application report provides generic guidelines and approach. All the specifications provided in the data manual take precedence over the generic guidelines and must be adhered to for a reliable DDR2 interface operation.

7.7.2.2.2.1 DDR2 Interface Schematic

图 7-39 shows the schematic connections for 16-bit interface on AM3358-EP device using one x16 DDR2 device and 图 7-40 shows the schematic connections for 16-bit interface on AM3358-EP using two x8 DDR2 devices. The AM3358-EP DDR2 memory interface only supports 16-bit wide mode of operation. The AM3358-EP device can only source one load connected to the DQS[x] and DQ[x] net class signals and two loads connected to the CK and ADDR_CTRL net class signals. For more information related to net classes, see 节 7.7.2.2.2.8.

图 7-40. 16-Bit DDR2 Interface Using Two 8-Bit DDR2 Devices

7.7.2.2.2.2 Compatible JEDEC DDR2 Devices

表 7-45 shows the parameters of the JEDEC DDR2 devices that are compatible with this interface. Generally, the DDR2 interface is compatible with x16 or x8 DDR2-533 speed grade DDR2 devices.

表 7-45. Compatible JEDEC DDR2 Devices (Per Interface)(1)

NO.	PARAMETER	MIN	MAX	UNIT
1	JEDEC DDR2 device speed grade(2)	DDR2-533		
2	JEDEC DDR2 device bit width	x8	x16	bits
3	JEDEC DDR2 device count	1	2	devices
4	JEDEC DDR2 device terminal count(3)	60	84	terminals

(1) If the DDR2 interface is operated with a clock frequency less than 266 MHz, lower-speed grade DDR2 devices may be used if the minimum clock period specified for the DDR2 device is less than or equal to the minimum clock period selected for the AM3358-EP DDR2 interface.

(2) Higher DDR2 speed grades are supported due to inherent JEDEC DDR2 backwards compatibility.

(3) 92-terminal devices are also supported for legacy reasons. New designs will migrate to 84-terminal DDR2 devices. Electrically, the 92- and 84-terminal DDR2 devices are the same.

7.7.2.2.2.3 PCB Stackup

The minimum stackup required for routing the AM3358-EP device is a four-layer stackup as shown in 表 7-46. Additional layers may be added to the PCB stackup to accommodate other circuitry, enhance signal integrity and electromagnetic interference performance, or to reduce the size of the PCB footprint.

表 7-46. Minimum PCB Stackup(1)

LAYER	TYPE	DESCRIPTION
1	Signal	Top signal routing
2	Plane	Ground
3	Plane	Split power plane
4	Signal	Bottom signal routing

(1) All signals that have critical signal integrity requirements should be routed first on layer 1. It may not be possible to route all of these signals on layer 1 which requires some to be routed on layer 4. When this is done, the signal routes on layer 4 should not cross splits in the power plane.

Complete stackup specifications are provided in 表 7-47.

表 7-47. PCB Stackup Specifications(1)

NO.	PARAMETER	MIN	TYP	MAX	UNIT
1	PCB routing and plane layers	4			
2	Signal routing layers	2			
3	Full ground layers under DDR2 routing region	1			
4	Number of ground plane cuts allowed within DDR2 routing region			0	
5	Full VDDS_DDR power reference layers under DDR2 routing region	1			
6	Number of layers between DDR2 routing layer and reference ground plane			0	
7	PCB routing feature size		4		mils
8	PCB trace width, w		4		mils
9	PCB BGA escape via pad size(2)		18	20	mils
10	PCB BGA escape via hole size(2)		10		mils
11	Single-ended impedance, Zo(3)		50	75	Ω
12	Impedance control(4)(5)	Zo-5	Zo	Zo+5	Ω

(1) For the DDR2 device BGA pad size, see the DDR2 device manufacturer documentation.

(2) A 20-10 via may be used if enough power routing resources are available. An 18-10 via allows for more flexible power routing to the AM3358-EP device.

(3) Zo is the nominal singled-ended impedance selected for the PCB.

(4) This parameter specifies the AC characteristic impedance tolerance for each segment of a PCB signal trace relative to the chosen Zo defined by the single-ended impedance parameter.

(5) Tighter impedance control is required to ensure flight time skew is minimal.

7.7.2.2.2.4 Placement

图 7-41 shows the required placement for the DDR2 devices. The dimensions for this figure are defined in 表 7-48. The placement does not restrict the side of the PCB on which the devices are mounted. The ultimate purpose of the placement is to limit the maximum trace lengths and allow for proper routing space. For single-memory DDR2 systems, the second DDR2 device is omitted from the placement.

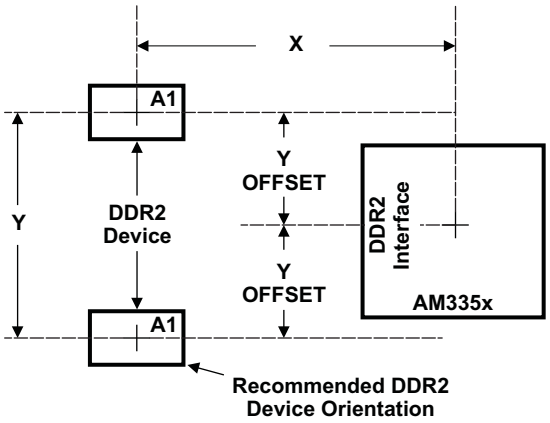

图 7-41. AM3358-EP Device and DDR2 Device Placement

表 7-48. Placement Specifications(1)

NO.	PARAMETER	MIN	MAX	UNIT
1	X(2)(3)		1750	mils
2	Y(2)(3)		1280	mils
3	Y Offset(2)(3)(4)		650	mils
4	Clearance from non-DDR2 signal to DDR2 keepout region(5)(6)	4		w

(1) DDR2 keepout region to encompass entire DDR2 routing area.

(2) For dimension definitions, see 图 7-41.

(3) Measurements from center of AM3358-EP device to center of DDR2 device.

(4) For single-memory systems, it is recommended that Y offset be as small as possible.

(5) w is defined as the signal trace width.

(6) Non-DDR2 signals allowed within DDR2 keepout region provided they are separated from DDR2 routing layers by a ground plane.

7.7.2.2.2.5 DDR2 Keepout Region

The region of the PCB used for the DDR2 circuitry must be isolated from other signals. The DDR2 keepout region is defined for this purpose and is shown in 图 7-42. This region should encompass all DDR2 circuitry and the region size varies with component placement and DDR2 routing. Additional clearances required for the keepout region are shown in 表 7-48. Non-DDR2 signals should not be routed on the same signal layer as DDR2 signals within the DDR2 keepout region. Non-DDR2 signals may be routed in the region provided they are routed on layers separated from DDR2 signal layers by a ground layer. No breaks should be allowed in the reference ground or VDDS_DDR power plane in this region. In addition, the VDDS_DDR power plane should cover the entire keepout region.

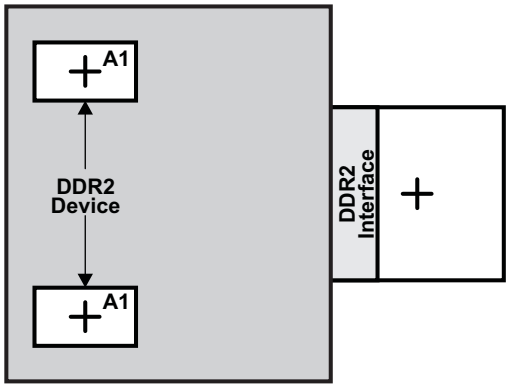

图 7-42. DDR2 Keepout Region

7.7.2.2.2.6 Bulk Bypass Capacitors

Bulk bypass capacitors are required for moderate speed bypassing of the DDR2 and other circuitry. 表 7-49 contains the minimum numbers and capacitance required for the bulk bypass capacitors. Note that this table only covers the bypass needs of the AM3358-EP DDR2 interface and DDR2 devices. Additional bulk bypass capacitance may be needed for other circuitry.

表 7-49. Bulk Bypass Capacitors(1)

NO.	PARAMETER	MIN	MAX	UNIT
1	AM3358-EP VDDS_DDR bulk bypass capacitor count	1		devices
2	AM3358-EP VDDS_DDR bulk bypass total capacitance	10		µF
3	DDR2 number 1 bulk bypass capacitor count	1		devices
4	DDR2 number 1 bulk bypass total capacitance	10		µF
5	DDR2 number 2 bulk bypass capacitor count(2)	1		devices
6	DDR2 number 2 bulk bypass total capacitance(2)	10		µF

(1) These devices should be placed near the device they are bypassing, but preference should be given to the placement of the high-speed (HS) bypass capacitors.

(2) Only used when two DDR2 devices are used.

7.7.2.2.2.7 High-Speed (HS) Bypass Capacitors

HS bypass capacitors are critical for proper DDR2 interface operation. It is particularly important to minimize the parasitic series inductance of the HS bypass capacitors, AM3358-EP device DDR2 power, and AM3358-EP device DDR2 ground connections. 表 7-50 contains the specification for the HS bypass capacitors as well as for the power connections on the PCB.

表 7-50. HS Bypass Capacitors

NO.	PARAMETER	MIN	MAX	UNIT
1	HS bypass capacitor package size(1)		0402	10 mils
2	Distance from HS bypass capacitor to device being bypassed		250	mils
3	Number of connection vias for each HS bypass capacitor(2)	2		vias
4	Trace length from bypass capacitor contact to connection via		30	mils
5	Number of connection vias for each AM3358-EP VDDS_DDR and VSS terminal	1		vias
6	Trace length from AM3358-EP VDDS_DDR and VSS terminal to connection via		35	mils
7	Number of connection vias for each DDR2 device power and ground terminal	1		vias
8	Trace length from DDR2 device power and ground terminal to connection via		35	mils
9	AM3358-EP VDDS_DDR HS bypass capacitor count(3)	10		devices
10	AM3358-EP VDDS_DDR HS bypass capacitor total capacitance	0.6		µF
11	DDR2 device HS bypass capacitor count(3)(4)	8		devices
12	DDR2 device HS bypass capacitor total capacitance(4)	0.4		µF

(1) LxW, 10-mil units; for example, a 0402 is a 40x20-mil surface-mount capacitor.

(2) An additional HS bypass capacitor can share the connection vias only if it is mounted on the opposite side of the board.

(3) These devices should be placed as close as possible to the device being bypassed.

(4) Per DDR2 device.

7.7.2.2.2.8 Net Classes

表 7-51 lists the clock net classes for the DDR2 interface. 表 7-52 lists the signal net classes, and associated clock net classes, for the signals in the DDR2 interface. These net classes are used for the termination and routing rules that follow.

表 7-51. Clock Net Class Definitions

CLOCK NET CLASS	AM3358-EP PIN NAMES
CK	DDR_CK and DDR_CKn
DQS0	DDR_DQS0 and DDR_DQSn0
DQS1	DDR_DQS1 and DDR_DQSn1

表 7-52. Signal Net Class Definitions

SIGNAL NET CLASS	ASSOCIATED CLOCK NET CLASS	AM3358-EP PIN NAMES
ADDR_CTRL	CK	DDR_BA[2:0], DDR_A[15:0], DDR_CSn0, DDR_CASn, DDR_RASn, DDR_WEn, DDR_CKE, DDR_ODT
DQ0	DQS0	DDR_D[7:0], DDR_DQM0
DQ1	DQS1	DDR_D[15:8], DDR_DQM1

7.7.2.2.2.9 DDR2 Signal Termination

Signal terminations are required on the CK and ADDR_CTRL net class signals. Serial terminations should be used on the CK and ADDR_CTRL lines and is the preferred termination scheme. On-device terminations (ODTs) are required on the DQS[x] and DQ[x] net class signals. They should be enabled to ensure signal integrity. 表 7-53 shows the specifications for the series terminators. Placement of serial terminations for ADDR_CTRL net class signals should be close to the AM3358-EP device.

表 **7-53. DDR2 Signal Terminations**

NO.	PARAMETER	MIN	TYP	MAX	UNIT
1	CK net class(1)	0		10	Ω
2	ADDR_CTRL net class(1)(2)(3)	0	22	Zo(4)	Ω
3	DQS0, DQS1, DQ0, and DQ1 net classes(5)	N/A		N/A	Ω

(1) Only series termination is permitted.

(2) Series termination values larger than typical only recommended to address EMI issues.

(3) Series termination values should be uniform across net class.

(4) Zo is the DDR2 PCB trace characteristic impedance.

(5) No external termination resistors are allowed and ODT must be used for these net classes.

If the DDR2 interface is operated at a lower frequency (<200-MHz clock rate), on-device terminations are not specifically required for the DQS[x] and DQ[x] net class signals and serial terminations for the CK and ADDR_CTRL net class signals are not mandatory. System designers may evaluate the need for serial terminators for EMI and overshoot reduction. Placement of serial terminations for DQS[x] and DQ[x] net class signals should be determined based on PCB analysis. Placement of serial terminations for ADDR_CTRL net class signals should be close to the AM3358-EP device. 表 7-54 shows the specifications for the serial terminators in such cases.

表 **7-54. Lower-Frequency DDR2 Signal Terminations**

NO.	PARAMETER	MIN	TYP	MAX	UNIT
1	CK net class(1)	0	22	Zo(2)	Ω
2	ADDR_CTRL net class(1)(3)(4)	0	22	Zo(2)	Ω
3	DQS0, DQS1, DQ0, and DQ1 net classes	0	22	Zo(2)	Ω

(1) Only series termination is permitted.

(2) Zo is the DDR2 PCB trace characteristic impedance.

(3) Series termination values larger than typical only recommended to address EMI issues.

(4) Series termination values should be uniform across net class.

7.7.2.2.2.10 DDR_VREF Routing

DDR_VREF is used as a reference by the input buffers of the DDR2 memories as well as the AM3358-EP device. DDR_VREF is intended to be half the DDR2 power supply voltage and should be created using a resistive divider as shown in 图 7-39 and 图 7-40. TI does not recommend other methods of creating DDR_VREF. 图 7-43 shows the layout guidelines for DDR_VREF.

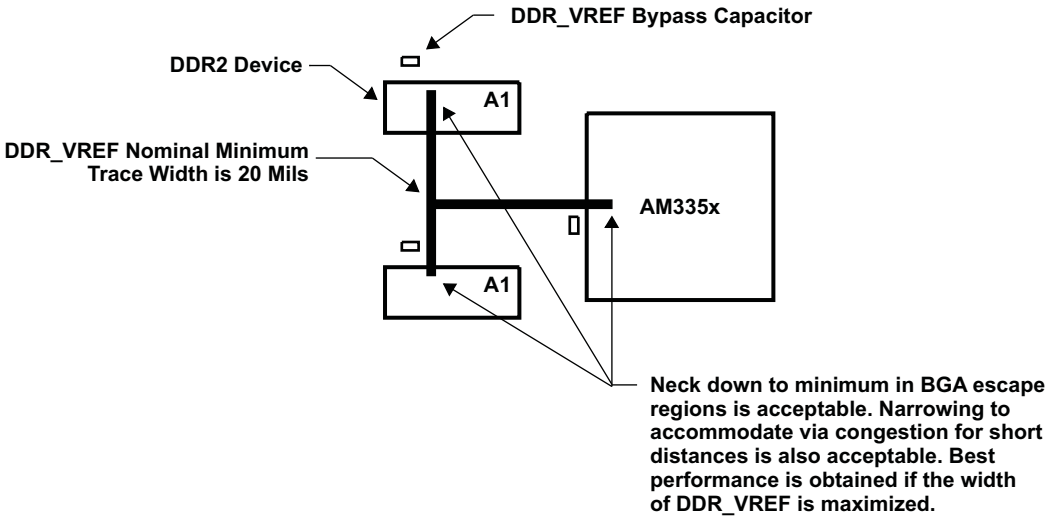

图 7-43. DDR_VREF Routing and Topology

7.7.2.2.3 DDR2 CK and ADDR_CTRL Routing

图 7-44 shows the topology of the routing for the CK and ADDR_CTRL net classes. The length of signal path AB and AC should be minimized with emphasis to minimize lengths C and D such that length A is the majority of the total length of signal path AB and AC.

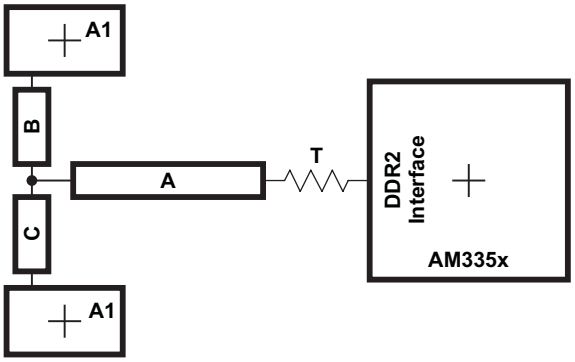

图 7-44. CK and ADDR_CTRL Routing and Topology

表 7-55. CK and ADDR_CTRL Routing Specification(1)(2)

NO.	PARAMETER	MIN	TYP	MAX	UNIT
1	Center-to-center CK spacing			2w

10	ADDR_CTRL A-to-B and ADDR_CTRL A-to-C skew length mismatch(2)			100	mils
11	ADDR_CTRL B-to-C skew length mismatch			100	mils

(1) CK represents the clock net class, and ADDR_CTRL represents the address and control signal net class.

(2) Series terminator, if used, should be located closest to the AM3358-EP device.

(3) Differential impedance should be Zo x 2, where Zo is the single-ended impedance defined in 表 7-47.

(4) Center-to-center spacing is allowed to fall to minimum (w) for up to 500 mils of routed length to accommodate BGA escape and routing congestion.

(5) CACLM is the longest Manhattan distance of the CK and ADDR_CTRL net classes.

图 7-45 shows the topology and routing for the DQS[x] and DQ[x] net classes; the routes are point to point. Skew matching across bytes is not needed nor recommended.

7	Center-to-center DQ[x] to other DDR2 trace spacing(3)(5)	4w			
8	Center-to-center DQ[x] to other DQ[x] trace spacing(3)(6)	3w			

(1) DQS[x] represents the DQS0 and DQS1 clock net classes, and DQ[x] represents the DQ0 and DQ1 signal net classes.

(2) Differential impedance should be Zo x 2, where Zo is the single-ended impedance defined in 表 7-47.

(3) Center-to-center spacing is allowed to fall to minimum (w) for up to 500 mils of routed length to accommodate BGA escape and routing congestion.

(4) There is no requirement for skew matching between data bytes; that is, from net classes DQS0 and DQ0 to net classes DQS1 and DQ1.

(5) Signals from one DQ net class should be considered other DDR2 traces to another DQ net class.

(6) DQLM is the longest Manhattan distance of each of the DQS[x] and DQ[x] net classes.

7.7.2.3 DDR3 and DDR3L Routing Guidelines

注

All references to DDR3 in this section apply to DDR3 and DDR3L devices, unless otherwise noted.

7.7.2.3.1 Board Designs

TI only supports board designs utilizing DDR3 memory that follow the guidelines in this document. The switching characteristics and timing diagram for the DDR3 memory interface are shown in 表 7-57 and 图 7-46.

表 **7-57. Switching Characteristics for DDR3 Memory Interface**

NO.	PARAMETER		MIN	MAX	UNIT
1	$t_{c(DDR\_CK)}$ $t_{c(DDR\_CKn)}$	Cycle time, DDR_CK and DDR_CKn	2.5	3.3(1)	ns

(1) The JEDEC JESD79-3F Standard defines the maximum clock period of 3.3 ns for all standard-speed bin DDR3 and DDR3L memory devices. Therefore, all standard-speed bin DDR3 and DDR3L memory devices are required to operate at 303 MHz.

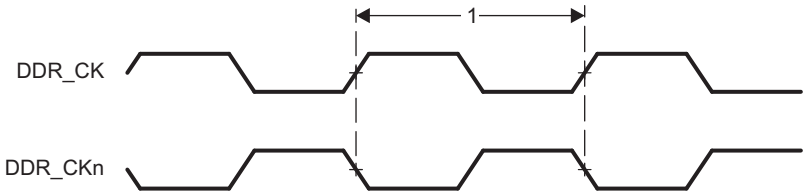

图 **7-46. DDR3 Memory Interface Clock Timing**

7.7.2.3.1.1 DDR3 versus DDR2

This specification only covers AM3358-EP PCB designs that utilize DDR3 memory. Designs using DDR2 memory should use the DDR2 routing guidleines described in 节 7.7.2.2. While similar, the two memory systems have different requirements. It is currently not possible to design one PCB that meets the requirements of both DDR2 and DDR3.

7.7.2.3.2 DDR3 Device Combinations

Since there are several possible combinations of device counts and single-side or dual-side mounting, 表 7-58 summarizes the supported device configurations.

表 **7-58. Supported DDR3 Device Combinations**

NUMBER OF DDR3 DEVICES	DDR3 DEVICE WIDTH (BITS)	MIRRORED?	DDR3 EMIF WIDTH (BITS)
1	16	N	16
2	8	Y(1)	16

(1) Two DDR3 devices are mirrored when one device is placed on the top of the board and the second device is placed on the bottom of the board.

7.7.2.3.3 DDR3 Interface

This section provides the timing specification for the DDR3 interface as a PCB design and manufacturing specification. The design rules constrain PCB trace length, PCB trace skew, signal integrity, cross-talk, and signal timing. These rules, when followed, result in a reliable DDR3 memory system without the need for a complex timing closure process. For more information regarding the guidelines for using this DDR3 specification, see the *Understanding TI's PCB Routing Rule-Based DDR Timing Specification* application report (SPRAAV0). This application report provides generic guidelines and approach. All the specifications provided in the data manual take precedence over the generic guidelines and must be adhered to for a reliable DDR3 interface operation.

7.7.2.3.3.1 DDR3 Interface Schematic

The DDR3 interface schematic varies, depending upon the width of the DDR3 devices used. 图 7-47 shows the schematic connections for 16-bit interface on AM3358-EP device using one x16 DDR3 device and 图 7-49 shows the schematic connections for 16-bit interface on AM3358-EP device using two x8 DDR3 devices. The AM3358-EP DDR3 memory interface only supports 16-bit wide mode of operation. The AM3358-EP device can only source one load connected to the DQS[x] and DQ[x] net class signals and two loads connected to the CK and ADDR_CTRL net class signals. For more information related to net classes, see 节 7.7.2.3.3.8.

(1) For valid DDR3 device configurations and device counts, see 节 7.7.2.3.3.1, 图 7-47, and 图 7-49.

7.7.2.3.3.3 PCB Stackup

The minimum stackup for routing the DDR3 interface is a four-layer stack up as shown in 表 7-60. Additional layers may be added to the PCB stackup to accommodate other circuitry, enhance signal integrity and electromagnetic interference performance, or to reduce the size of the PCB footprint.

表 7-60. Minimum PCB Stackup(1)

LAYER	TYPE	DESCRIPTION
1	Signal	Top signal routing
2	Plane	Ground
3	Plane	Split Power Plane
4	Signal	Bottom signal routing

(1) All signals that have critical signal integrity requirements should be routed first on layer 1. It may not be possible to route all of these signals on layer 1 which requires some to be routed on layer 4. When this is done, the signal routes on layer 4 should not cross splits in the power plane.

表 7-61. PCB Stackup Specifications[1]

NO.	PARAMETER	MIN	TYP	MAX	UNIT
1	PCB routing and plane layers	4			
2	Signal routing layers	2			
3	Full ground reference layers under DDR3 routing region[2]	1			
4	Full VDDS_DDR power reference layers under the DDR3 routing region[2]	1			
5	Number of reference plane cuts allowed within DDR3 routing region[3]			0	
6	Number of layers between DDR3 routing layer and reference plane[4]			0	
7	PCB routing feature size		4		mils
8	PCB trace width, w		4		mils
9	PCB BGA escape via pad size[5]		18	20	mils
10	PCB BGA escape via hole size		10		mils
11	Single-ended impedance, Zo[6]		50	75	Ω
12	Impedance control[7][8]	Zo-5	Zo	Zo+5	Ω

(1) For the DDR3 device BGA pad size, see the DDR3 device manufacturer documentation.

(2) Ground reference layers are preferred over power reference layers. Be sure to include bypass caps to accommodate reference layer return current as the trace routes switch routing layers.

(3) No traces should cross reference plane cuts within the DDR3 routing region. High-speed signal traces crossing reference plane cuts create large return current paths which can lead to excessive crosstalk and EMI radiation.

(4) Reference planes are to be directly adjacent to the signal plane to minimize the size of the return current loop.

(5) An 18-mil pad assumes Via Channel is the most economical BGA escape. A 20-mil pad may be used if additional layers are available for power routing. An 18-mil pad is required for minimum layer count escape.

(6) Zo is the nominal singled-ended impedance selected for the PCB.

(7) This parameter specifies the AC characteristic impedance tolerance for each segment of a PCB signal trace relative to the chosen Zo defined by the single-ended impedance parameter.

(8) Tighter impedance control is required to ensure flight time skew is minimal.

7.7.2.3.3.4 Placement

图 7-50 shows the required placement for the AM3358-EP device as well as the DDR3 devices. The dimensions for this figure are defined in 表 7-62. The placement does not restrict the side of the PCB on which the devices are mounted. The ultimate purpose of the placement is to limit the maximum trace lengths and allow for proper routing space.

2	X2(2)(3)		600	mils
3	Y Offset(2)(3)(4)		1500	mils
4	Clearance from non-DDR3 signal to DDR3 keepout region(5)(6)	4		w

(1) DDR3 keepout region to encompass entire DDR3 routing area.
(2) For dimension definitions, see 图 7-50.
(3) Measurements from center of AM3358-EP device to center of DDR3 device.
(4) Minimizing X1 and Y improves timing margins.
(5) w is defined as the signal trace width.
(6) Non-DDR3 signals allowed within DDR3 keepout region provided they are separated from DDR3 routing layers by a ground plane.

7.7.2.3.3.5 DDR3 Keepout Region

The region of the PCB used for DDR3 circuitry must be isolated from other signals. The DDR3 keepout region is defined for this purpose and is shown in 图 7-51. This region should encompass all DDR3 circuitry and the region size varies with component placement and DDR3 routing. Additional clearances required for the keepout region are shown in 表 7-62. Non-DDR3 signals should not be routed on the same signal layer as DDR3 signals within the DDR3 keepout region. Non-DDR3 signals may be routed in the region provided they are routed on layers separated from DDR3 signal layers by a ground layer. No breaks should be allowed in the reference ground or VDDS_DDR power plane in this region. In addition, the VDDS_DDR power plane should cover the entire keepout region.

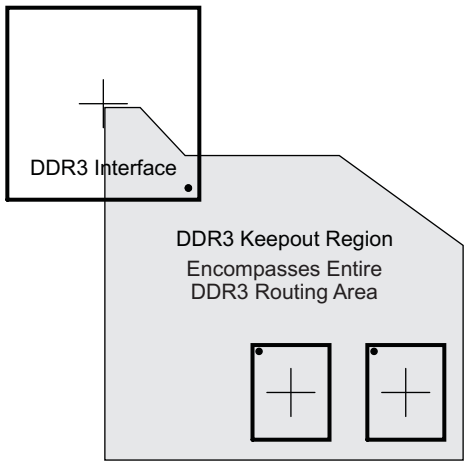

图 **7-51. DDR3 Keepout Region**

7.7.2.3.3.6 Bulk Bypass Capacitors

Bulk bypass capacitors are required for moderate speed bypassing of the DDR3 and other circuitry. 表 7-63 contains the minimum numbers and capacitance required for the bulk bypass capacitors. Note that this table only covers the bypass needs of the AM3358-EP DDR3 interface and DDR3 devices. Additional bulk bypass capacitance may be needed for other circuitry.

表 **7-63. Bulk Bypass Capacitors**(1)

NO.	PARAMETER	MIN	MAX	UNIT
1	AM3358-EP VDDS_DDR bulk bypass capacitor count	2		devices
2	AM3358-EP VDDS_DDR bulk bypass total capacitance	20		µF
3	DDR3 number 1 bulk bypass capacitor count	2		devices
4	DDR3 number 1 bulk bypass total capacitance	20		µF
5	DDR3 number 2 bulk bypass capacitor count(2)	2		devices
6	DDR3 number 2 bulk bypass total capacitance(2)	20		µF

(1) These devices should be placed near the devices they are bypassing, but preference should be given to the placement of the high-speed (HS) bypass capacitors and DDR3 signal routing.

(2) Only used when two DDR3 devices are used.

7.7.2.3.3.7 High-Speed Bypass Capacitors

High-speed (HS) bypass capacitors are critical for proper DDR3 interface operation. It is particularly important to minimize the parasitic series inductance of the HS bypass capacitors, AM3358-EP device DDR3 power, and AM3358-EP device DDR3 ground connections. 表 7-64 contains the specification for the HS bypass capacitors as well as for the power connections on the PCB. Generally speaking, it is good to:

- Fit as many HS bypass capacitors as possible.
- Minimize the distance from the bypass cap to the power terminals being bypassed.
- Use the smallest physical sized capacitors possible with the highest capacitance readily available.
- Connect the bypass capacitor pads to their vias using the widest traces possible and using the largest hole size via possible.
- Minimize via sharing. Note the limits on via sharing shown in 表 7-64.

表 7-64. High-Speed Bypass Capacitors

NO.	PARAMETER	MIN	TYP	MAX	UNIT

11	Number of connection vias for each DDR3 device power and ground terminal(9)	1			vias
12	Trace length from DDR3 device power and ground terminal to connection via(2)(7)		35	60	mils

(1) LxW, 10-mil units; for example, a 0402 is a 40x20-mil surface-mount capacitor.

(2) Closer and shorter is better.

(3) Measured from the nearest AM3358-EP VDDS_DDR and ground terminal to the center of the capacitor package.

(4) Three of these capacitors should be located underneath the AM3358-EP device, between the cluster of VDDS_DDR and ground terminals, between the DDR3 interfaces on the package.

(5) Measured from the DDR3 device power and ground terminal to the center of the capacitor package.

(6) Per DDR3 device.

(7) An additional HS bypass capacitor can share the connection vias only if it is mounted on the opposite side of the board. No sharing of vias is permitted on the same side of the board.

(8) An HS bypass capacitor may share a via with a DDR3 device mounted on the same side of the PCB. A wide trace should be used for the connection and the length from the capacitor pad to the DDR3 device pad should be less than 150 mils.

(9) Up to a total of two pairs of DDR3 power and ground terminals may share a via.

7.7.2.3.3.7.1 Return Current Bypass Capacitors

Use additional bypass capacitors if the return current reference plane changes due to DDR3 signals hopping from one signal layer to another. The bypass capacitor here provides a path for the return current to hop planes along with the signal. As many of these return current bypass capacitors should be used as possible. Since these are returns for signal current, the signal via size may be used for these capacitors.

7.7.2.3.3.8 Net Classes

表 7-65 lists the clock net classes for the DDR3 interface. 表 7-66 lists the signal net classes, and associated clock net classes, for signals in the DDR3 interface. These net classes are used for the termination and routing rules that follow.

表 7-65. Clock Net Class Definitions

CLOCK NET CLASS	AM3358-EP PIN NAMES
CK	DDR_CK and DDR_CKn
DQS0	DDR_DQS0 and DDR_DQSn0
DQS1	DDR_DQS1 and DDR_DQSn1

表 7-66. Signal Net Class Definitions

ADDR_CTRL	CK	DDR_BA[2:0], DDR_A[15:0], DDR_CSn0, DDR_CASn, DDR_RASn, DDR_WEn, DDR_CKE, DDR_ODT
DQ0	DQS0	DDR_D[7:0], DDR_DQM0
DQ1	DQS1	DDR_D[15:8], DDR_DQM1

7.7.2.3.3.9 DDR3 Signal Termination

Signal terminations are required for the CK and ADDR_CTRL net class signals. On-device terminations (ODTs) are required on the DQS[x] and DQ[x] net class signals. Detailed termination specifications are covered in the routing rules in the following sections.

图 7-48 provides an example DDR3 schematic with a single 16-bit DDR3 memory device that does not have V_{TT} termination on the address and control signals. A typical DDR3 point-to-point topology may provide acceptable signal integrity without V_{TT} termination. System performance should be verified by performing signal integrity analysis using specific PCB design details before implementing this topology.

7.7.2.3.3.10 DDR_VREF Routing

DDR_VREF is used as a reference by the input buffers of the DDR3 memories as well as the AM3358-EP device. DDR_VREF is intended to be half the DDR3 power supply voltage and is typically generated with a voltage divider connected to the VDDS_DDR power supply. It should be routed as a nominal 20-mil wide trace with 0.1 µF bypass capacitors near each device connection. Narrowing of DDR_VREF is allowed to accommodate routing congestion.

7.7.2.3.3.11 VTT

Like DDR_VREF, the nominal value of the VTT supply is half the DDR3 supply voltage. Unlike DDR_VREF, VTT is expected to source and sink current, specifically the termination current for the ADDR_CTRL net class Thevinen terminators. VTT is needed at the end of the address bus and it should be routed as a power sub-plane. VTT should be bypassed near the terminator resistors.

7.7.2.3.4 DDR3 CK and ADDR_CTRL Topologies and Routing Definition

The CK and ADDR_CTRL net classes are routed similarly and are length matched to minimize skew between them. CK is a bit more complicated because it runs at a higher transition rate and is differential. The following subsections show the topology and routing for various DDR3 configurations for CK and ADDR_CTRL. The figures in the following subsections define the terms for the routing specification detailed in 表 7-67.

7.7.2.3.4.1 Two DDR3 Devices

Two DDR3 devices are supported on the DDR3 interface consisting of two x8 DDR3 devices arranged as one 16-bit bank. These two devices may be mounted on a single side of the PCB, or may be mirrored in a pair to save board space at a cost of increased routing complexity and parts on the backside of the PCB.

7.7.2.3.5 Data Topologies and Routing Definition

No matter the number of DDR3 devices used, the data line topology is always point to point, so its definition is simple.

7.7.2.3.5.1 DQS[x] and DQ[x] Topologies, Any Number of Allowed DDR3 Devices

DQS[x] lines are point-to-point differential, and DQ[x] lines are point-to-point singled ended. 图 7-62 and 图 7-63 show these topologies.

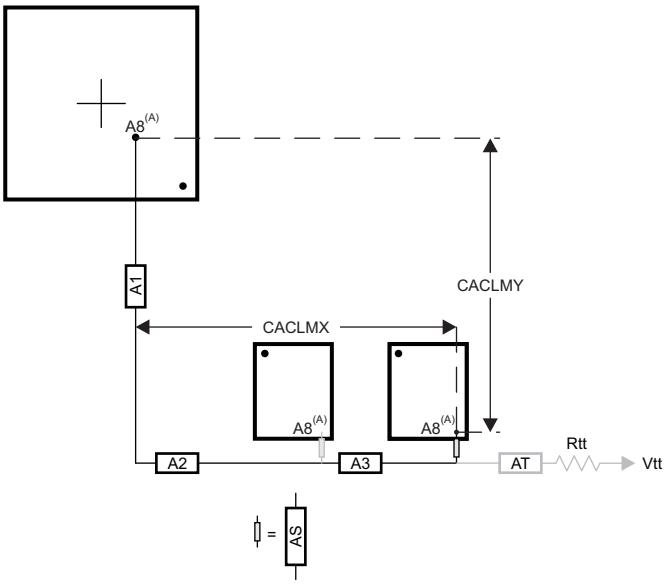
7.7.2.3.6 Routing Specification

7.7.2.3.6.1 CK and ADDR_CTRL Routing Specification

Skew within the CK and ADDR_CTRL net classes directly reduces setup and hold margin and, thus, this skew must be controlled. The only way to practically match lengths on a PCB is to lengthen the shorter traces up to the length of the longest net in the net class and its associated clock. A metric to establish this maximum length is Manhattan distance. The Manhattan distance between two points on a PCB is the length between the points when connecting them only with horizontal or vertical segments. A reasonable trace route length is to within a percentage of its Manhattan distance. CACLM is defined as Clock Address Control Longest Manhattan distance.

Given the clock and address pin locations on the AM3358-EP device and the DDR3 memories, the maximum possible Manhattan distance can be determined given the placement. 图 7-66 shows this distance for two loads. It is from this distance that the specifications on the lengths of the transmission lines for the address bus are determined. CACLM is determined similarly for other address bus configurations; that is, it is based on the longest net of the CK and ADDR_CTRL net class. For CK and ADDR_CTRL routing, these specifications are contained in 表 7-67.



A. It is very likely that the longest CK and ADDR_CTRL Manhattan distance will be for Address Input 8 (A8) on the DDR3 memories. CACLM is based on the longest Manhattan distance due to the device placement. Verify the net class that satisfies this criteria and use as the baseline for CK and ADDR_CTRL skew matching and length control.

The length of shorter CK and ADDR_CTRL stubs as well as the length of the terminator stub are not included in this length calculation. Non-included lengths are grayed out in the figure.

Assuming A8 is the longest, CALM = CACLMY + CACLMX + 300 mils.
The extra 300 mils allows for routing down lower than the DDR3 memories and returning up to reach A8.

19	Rcp(13)	Zo-1	Zo	Zo+1	Ω
20	Rtt(13)(14)	Zo-5	Zo	Zo+5	Ω

(1) CK represents the clock net class, and ADDR_CTRL represents the address and control signal net class.

(2) The use of vias should be minimized.

(3) Additional bypass capacitors are required when using the VDDS_DDR plane as the reference plane to allow the return current to jump between the VDDS_DDR plane and the ground plane when the net class switches layers at a via.

(4) Mirrored configuration (one DDR3 device on top of the board and one DDR3 device on the bottom).

(5) Non-mirrored configuration (all DDR3 memories on same side of PCB).

(6) While this length can be increased for convenience, its length should be minimized.

(7) ADDR_CTRL net class only (not CK net class). Minimizing this skew is recommended, but not required.

(8) CK net class only.

(9) CACLM is the longest Manhattan distance of the CK and ADDR_CTRL net classes + 300 mils. For definition, see 节 7.7.2.3.6.1 and 图 7-66.

(10) Center-to-center spacing is allowed to fall to minimum (w) for up to 1250 mils of routed length.

(11) Signals from one DQ net class should be considered other DDR3 traces to another DQ net class.

(12) CK spacing set to ensure proper differential impedance. Differential impedance should be Z_o x 2, where Z_o is the single-ended impedance defined in 表 7-61.

(13) Source termination (series resistor at driver) is specifically not allowed.

(14) Termination values should be uniform across the net class.

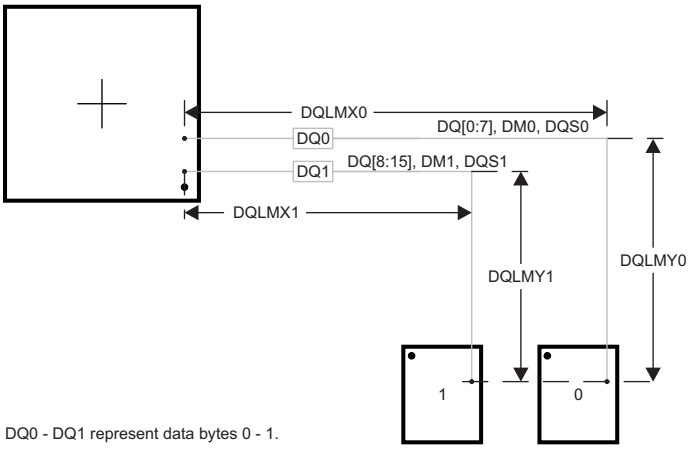
7.7.2.3.6.2 DQS[x] and DQ[x] Routing Specification

Skew within the DQS[x] and DQ[x] net classes directly reduces setup and hold margin and, thus, this skew must be controlled. The only way to practically match lengths on a PCB is to lengthen the shorter traces up to the length of the longest net in the net class and its associated clock. DQLMn is defined as DQ Longest Manhattan distance n, where n is the byte number. For a 16-bit interface, there are two DQLMs, DQLM0-DQLM1.

注

It is not required, nor is it recommended, to match the lengths across all bytes. Length matching is only required within each byte.

Given the DQS[x] and DQ[x] pin locations on the AM3358-EP device and the DDR3 memories, the maximum possible Manhattan distance can be determined given the placement. 图 7-67 shows this distance for a two-load case. It is from this distance that the specifications on the lengths of the transmission lines for the data bus are determined. For DQS[x] and DQ[x] routing, these specifications are contained in 表 7-68.



There are two DQLMs, one for each byte (16-bit interface). Each DQLM is the longest Manhattan distance of the byte; therefore:
DQLM0 = DQLMX0 + DQLMY0
DQLM1 = DQLMX1 + DQLMY1

图 **7-67. DQLM for Any Number of Allowed DDR3 Devices**

4	DQS[x] skew			5	mils
5	DQS[x]-to-DQ[x] skew(6)(7)			25	mils
6	Center-to-center DQ[x] to other DDR3 trace spacing(8)(9)	4w			
7	Center-to-center DQ[x] to other DQ[x] trace spacing(8)(10)	3w			
8	DQS[x] center-to-center spacing(11)				
9	DQS[x] center-to-center spacing to other net(8)	4w			

(1) DQS[x] represents the DQS0 and DQS1 clock net classes, and DQ[x] represents the DQ0 and DQ1 signal net classes.

(2) External termination disallowed. Data termination should use built-in ODT functionality.

(3) DQLMn is the longest Manhattan distance of a byte. For definition, see 节 7.7.2.3.6.2 and 图 7-67.

(4) DQLM0 is the longest Manhattan length for the DQ0 net class.

(5) DQLM1 is the longest Manhattan length for the DQ1 net class.

(6) Length matching is only done within a byte. Length matching across bytes is not required.

(7) Each DQS clock net class is length matched to its associated DQ signal net class.

(8) Center-to-center spacing is allowed to fall to minimum for up to 1250 mils of routed length.

(9) Other DDR3 trace spacing means signals that are not part of the same DQ[x] signal net class.

(10) This applies to spacing within same DQ[x] signal net class.

(11) DQS[x] pair spacing is set to ensure proper differential impedance. Differential impedance should be Z_o x 2, where Z_o is the single-ended impedance defined in 表 7-61.

(1) A fast-mode I²C-bus device can be used in a standard-mode I²C-bus system, but the requirement $t_{su(SDA-SCLH)} \geq 250$ ns must then be met. This is automatically the case if the device does not stretch the LOW period of the SCL signal. If such a device stretches the LOW period of the SCL signal, it must output the next data bit to the SDA line $t_{r\ max} + t_{su(SDA-SCLH)} = 1000 + 250 = 1250$ ns (according to the standard-mode I²C-Bus Specification) before the SCL line is released.

(2) A device must internally provide a hold time of at least 300 ns for the SDA signal (referred to the V_{IHmin} of the SCL signal) to bridge the undefined region of the falling edge of SCL.

(3) The maximum $t_{h(SDA-SCLL)}$ has only to be met if the device does not stretch the low period [$t_{w(SCLL)}$] of the SCL signal.

7.10 LCD Controller (LCDC)

The LCDC consists of two independent controllers, the raster controller and the LCD interface display driver (LIDD) controller. Each controller operates independently from the other and only one of them is active at any given time.

- The raster controller handles the synchronous LCD interface. It provides timing and data for constant graphics refresh to a passive display. It supports a wide variety of monochrome and full-color display types and sizes by use of programmable timing controls, a built-in palette, and a gray-scale and serializer. Graphics data is processed and stored in frame buffers. A frame buffer is a contiguous memory block in the system. A built-in DMA engine supplies the graphics data to the raster engine which, in turn, outputs to the external LCD device.
- The LIDD controller supports the asynchronous LCD interface. It provides full-timing programmability of control signals (CS, WE, OE, ALE) and output data.

The maximum resolution for the LCD controller is 2048 × 2048 pixels. The maximum frame rate is determined by the image size in combination with the pixel clock rate.

Frame-to-frame timing is derived through the following parameters in the LCD (RASTER_TIMING_1) register:

- Vertical front porch (VFP)
- Vertical sync pulse width (VSW)
- Vertical back porch (VBP)
- Lines per panel (LPP_B10 + LPP)

Line-to-line timing is derived through the following parameters in the LCD (RASTER_TIMING_0) register:

- Horizontal front porch (HFP)
- Horizontal sync pulse width (HSW)
- Horizontal back porch (HBP)
- Pixels per panel (PPLMSB + PPLLSB)

LCD_AC_BIAS_EN timing is derived through the following parameter in the LCD (RASTER_TIMING_2) register:

- AC bias frequency (ACB)

The display format produced in raster mode is shown in 图 7-81. An entire frame is delivered one line at a time. The first line delivered starts at data pixel (1, 1) and ends at data pixel (P, 1). The last line delivered starts at data pixel (1, L) and ends at data pixel (P, L). The beginning of each new frame is denoted by the activation of IO signal LCD_VSYNC. The beginning of each new line is denoted by the activation of IO signal LCD_HSYNC.

7.11 Multichannel Audio Serial Port (McASP)

The multichannel audio serial port (McASP) functions as a general-purpose audio serial port optimized for the needs of multichannel audio applications. The McASP is useful for time-division multiplexed (TDM) stream, Inter-Integrated Sound (I^2S) protocols, and inter-component digital audio interface transmission (DIT).

7.11.1 McASP Device-Specific Information

The device includes two multichannel audio serial port (McASP) interface peripherals (McASP0 and McASP1). The McASP module consists of a transmit and receive section. These sections can operate completely independently with different data formats, separate master clocks, bit clocks, and frame syncs or, alternatively, the transmit and receive sections may be synchronized. The McASP module also includes shift registers that may be configured to operate as either transmit data or receive data.

The transmit section of the McASP can transmit data in either a time-division-multiplexed (TDM) synchronous serial format or in a digital audio interface (DIT) format where the bit stream is encoded for SPDIF, AES-3, IEC-60958, CP-430 transmission. The receive section of the McASP peripheral supports the TDM synchronous serial format.

The McASP module can support one transmit data format (either a TDM format or DIT format) and one receive format at a time. All transmit shift registers use the same format and all receive shift registers use the same format; however, the transmit and receive formats need not be the same. Both the transmit and receive sections of the McASP also support burst mode, which is useful for non-audio data (for example, passing control information between two devices).

The McASP peripheral has additional capability for flexible clock generation and error detection/handling, as well as error management.

The device McASP0 and McASP1 modules have up to four serial data pins each. The McASP FIFO size is 256 bytes and two DMA and two interrupt requests are supported. Buffers are used transparently to better manage DMA, which can be leveraged to manage data flow more efficiently.

For more detailed information on and the functionality of the McASP peripheral, see the Multichannel Audio Serial Port (McASP) section of the *AM335x Sitara Processors Technical Reference Manual* (SPRUH73).

(2) Pins SPIx_D0 and SPIx_D1 can function as SIMO or SOMI.

(3) The polarity of SPIx_CLK and the active edge (rising or falling) on which mcspix_simo is driven and mcspix_somi is latched is all software configurable:
- SPIx_CLK(1) phase programmable with the bit PHA of MCSPI_CH(i)CONF register: PHA = 1 (Modes 1 and 3).
- SPIx_CLK(1) phase programmable with the bit PHA of MCSPI_CH(i)CONF register: PHA = 0 (Modes 0 and 2).

(4) Case P = 20.8 ns, A = (TCS + 1) × TSPICLKREF (TCS is a bit field of MCSPI_CH(i)CONF register).

Case P > 20.8 ns, A = (TCS + 0.5) × Fratio × TSPICLKREF (TCS is a bit field of MCSPI_CH(i)CONF register).
Note: P = SPI_CLK clock period.

(5) B = (TCS + 0.5) × TSPICLKREF × Fratio (TCS is a bit field of MCSPI_CH(i)CONF register, Fratio: Even ≥ 2).

8 Device and Documentation Support

8.1 Device Support

8.1.1 Development Support

TI offers an extensive line of development tools, including tools to evaluate the performance of the processors, generate code, develop algorithm implementations, and fully integrate and debug software and hardware modules. The tool's support documentation is electronically available within the Code Composer Studio™ Integrated Development Environment (IDE).

The following products support development of AM3358-EP device applications:

Software Development Tools: Code Composer Studio™ Integrated Development Environment (IDE): including Editor C/C++/Assembly Code Generation, and Debug plus additional development tools Scalable, Real-Time Foundation Software (DSP/BIOS™), which provides the basic run-time target software needed to support any AM3358-EP device application.

Hardware Development Tools: Extended Development System (XDS™) Emulator

For a complete listing of development-support tools for the AM3358-EP microprocessor platform, visit the Texas Instruments website at www.ti.com. For information on pricing and availability, contact the nearest TI field sales office or authorized distributor.

8.1.2 Device Nomenclature

To designate the stages in the product development cycle, TI assigns prefixes to the part numbers of all microprocessors (MPUs) and support tools. Each device has one of three prefixes: X, P, or null (no prefix) (for example, XAM3358AGCZ). Texas Instruments recommends two of three possible prefix designators for its support tools: TMDX and TMDS. These prefixes represent evolutionary stages of product development from engineering prototypes (TMDX) through fully qualified production devices and tools (TMDS).

Device development evolutionary flow:

X Experimental device that is not necessarily representative of the final device's electrical specifications and may not use production assembly flow.

P Prototype device that is not necessarily the final silicon die and may not necessarily meet final electrical specifications.

null Production version of the silicon die that is fully qualified.

Support tool development evolutionary flow:

TMDX Development-support product that has not yet completed Texas Instruments internal qualification testing.

TMDS Fully-qualified development-support product.

X and P devices and TMDX development-support tools are shipped against the following disclaimer:

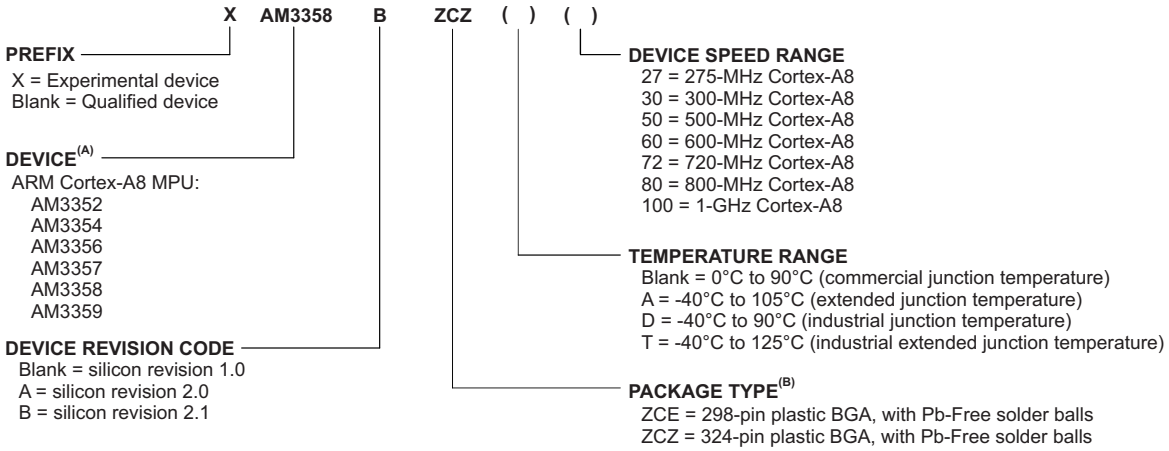
"Developmental product is intended for internal evaluation purposes."

Production devices and TMDS development-support tools have been characterized fully, and the quality and reliability of the device have been demonstrated fully. TI's standard warranty applies.

Predictions show that prototype devices (X or P) have a greater failure rate than the standard production devices. Texas Instruments recommends that these devices not be used in any production system because their expected end-use failure rate still is undefined. Only qualified production devices are to be used.

TI device nomenclature also includes a suffix with the device family name. This suffix indicates the package type (for example, GCZ), the temperature range (for example, blank is the default commercial temperature range), and the device speed range, in megahertz (for example, 27 is 275 MHz). 图 8-1 provides a legend for reading the complete device name for any AM3358-EP device.

For additional description of the device nomenclature markings on the die, see the *AM335x ARM Cortex-A8 Microprocessors (MPUs) Silicon Errata* (SPRZ360).



A. The AM3358-EP device shown in this device nomenclature example is one of several valid part numbers for the AM335x family of devices. For orderable device part numbers, see the Package Option Addendum of this document.

8.2 Documentation Support

8.2.1 Related Documentation

The following documents describe the AM3358-EP MPU. Copies of these documents are available on the Internet at www.ti.com.

The current documentation that describes the AM3358-EP MPU, related peripherals, and other technical collateral, is available in the product folder at: www.ti.com.

SPRUH73 *AM335x Sitara Processors Technical Reference Manual.* Collection of documents providing detailed information on the AM335x device including power, reset, and clock control, interrupts, memory map, and switch fabric interconnect. Detailed information on the microprocessor unit (MPU) subsystem as well as a functional description of the peripherals supported on AM335x devices is also included.

SPRZ360 ***AM335x Sitara Processors Silicon Errata.*** Describes the known exceptions to the functional specifications for the AM335x ARM Cortex-A8 Microprocessors.

The following documents are related to the MPU. Copies of these documents can be obtained directly from the internet or from your Texas Instruments representative. To determine the revision of the Cortex-A8 core used on your device, see the *AM335x Sitara Processors Silicon Errata* (SPRZ360).

8.5 静电放电警告

ESD 可能会损坏该集成电路。德州仪器 (TI) 建议通过适当的预防措施处理所有集成电路。如果不遵守正确的处理措施和安装程序，可能会损坏集成电路。

ESD 的损坏小至导致微小的性能降级，大至整个器件故障。 精密的集成电路可能更容易受到损坏，这是因为非常细微的参数更改都可能会导致器件与其发布的规格不相符。

This glossary lists and explains terms, acronyms, and definitions.

9 Mechanical, Packaging, and Orderable Information

9.1 Via Channel

The GCZ package has been specially engineered with Via Channel technology. This allows larger than normal PCB via and trace sizes and reduced PCB signal layers to be used in a PCB design with the 0.65-mm pitch package, and substantially reduces PCB costs. It allows PCB routing in only two signal layers (four layers total) due to the increased layer efficiency of the Via Channel BGA technology.

9.2 Packaging Information

The following pages include mechanical packaging and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

重要声明

德州仪器(TI) 及其下属子公司有权根据 JESD46 最新标准, 对所提供的产品和服务进行更正、修改、增强、改进或其它更改， 并有权根据 JESD48 最新标准中止提供任何产品和服务。客户在下订单前应获取最新的相关信息, 并验证这些信息是否完整且是最新的。所有产品的销售都遵循在订单确认时所提供的TI 销售条款与条件。

TI 保证其所销售的组件的性能符合产品销售时 TI 半导体产品销售条件与条款的适用规范。仅在 TI 保证的范围内，且 TI 认为 有必要时才会使用测试或其它质量控制技术。除非适用法律做出了硬性规定，否则没有必要对每种组件的所有参数进行测试。

TI 对应用帮助或客户产品设计不承担任何义务。客户应对其使用 TI 组件的产品和应用自行负责。为尽量减小与客户产品和应 用相关的风险，客户应提供充分的设计与操作安全措施。

TI 不对任何 TI 专利权、版权、屏蔽作品权或其它与使用了 TI 组件或服务的组合设备、机器或流程相关的 TI 知识产权中授予 的直接或隐含权限作出任何保证或解释。TI 所发布的与第三方产品或服务有关的信息，不能构成从 TI 获得使用这些产品或服 务的许可、授权、或认可。使用此类信息可能需要获得第三方的专利权或其它知识产权方面的许可，或是 TI 的专利权或其它 知识产权方面的许可。

对于 TI 的产品手册或数据表中 TI 信息的重要部分，仅在没有对内容进行任何篡改且带有相关授权、条件、限制和声明的情况 下才允许进行复制。TI 对此类篡改过的文件不承担任何责任或义务。复制第三方的信息可能需要服从额外的限制条件。

在转售 TI 组件或服务时，如果对该组件或服务参数的陈述与 TI 标明的参数相比存在差异或虚假成分，则会失去相关 TI 组件 或服务的所有明示或暗示授权，且这是不正当的、欺诈性商业行为。TI 对任何此类虚假陈述均不承担任何责任或义务。

客户认可并同意，尽管任何应用相关信息或支持仍可能由 TI 提供，但他们将独力负责满足与其产品及在其应用中使用 TI 产品 相关的所有法律、法规和安全相关要求。客户声明并同意，他们具备制定与实施安全措施所需的全部专业技术和知识，可预见 故障的危险后果、监测故障及其后果、降低有可能造成人身伤害的故障的发生机率并采取适当的补救措施。客户将全额赔偿因 在此类安全关键应用中使用任何 TI 组件而对 TI 及其代理造成的任何损失。

在某些场合中，为了推进安全相关应用有可能对 TI 组件进行特别的促销。TI 的目标是利用此类组件帮助客户设计和创立其特 有的可满足适用的功能安全性标准和要求的终端产品解决方案。尽管如此，此类组件仍然服从这些条款。

TI 组件未获得用于 FDA Class III（或类似的生命攸关医疗设备）的授权许可，除非各方授权官员已经达成了专门管控此类使 用的特别协议。

只有那些 TI 特别注明属于军用等级或“增强型塑料”的 TI 组件才是设计或专门用于军事/航空应用或环境的。购买者认可并同 意，对并非指定面向军事或航空航天用途的 TI 组件进行军事或航空航天方面的应用，其风险由客户单独承担，并且由客户独 力负责满足与此类使用相关的所有法律和法规要求。

TI 已明确指定符合 ISO/TS16949 要求的产品，这些产品主要用于汽车。在任何情况下，因使用非指定产品而无法达到 ISO/TS16949 要求，TI不承担任何责任。

(1) The marketing status values are defined as follows:
ACTIVE: Product device recommended for new designs.
LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.
NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.
PREVIEW: Device has been announced but is not in production. Samples may or may not be available.
OBSOLETE: TI has discontinued the production of the device.

(2) Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check http://www.ti.com/productcontent for the latest availability information and additional product content details.
TBD: The Pb-Free/Green conversion plan has not been defined.
Pb-Free (RoHS): TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.
Pb-Free (RoHS Exempt): This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.
Green (RoHS & no Sb/Br): TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.
