

A New Direction in Mixed-Signal

XR22804

Hi-Speed USB to 10/100 Ethernet Bridge

General Description

The XR22804 is a Hi-Speed USB 2.0 compound device with an embedded hub and 7 downstream USB functions: 10/100 Ethernet Controller, 4 UARTs, multi-master capable I²C controller, and an Enhanced Dedicated GPIO Entity (EDGE) controller.

The upstream USB interface has an integrated USB 2.0 PHY and device controller that is compliant with both Hi-Speed (480Mbps) and Full-Speed (12Mbps) USB 2.0. The vendor ID, product ID, power mode, remote wakeup support and maximum power consumption are amongst the values that can be programmed using the on-chip One-Time Programmable (OTP) memory.

The Ethernet controller has an integrated 10/100 Ethernet MAC and PHY and is compliant with IEEE 802.3. The Ethernet controller supports auto-negotiation, auto-MDIX, checksum offload, auto-polarity correction in 10Base-T and remote wakeup capabilities.

The enhanced UART has a maximum data rate of 15 Mbps. Using a fractional baud rate generator, any baud rate between 300 bps and 15 Mbps can be accurately generated. In addition, the UART has a large 1024-byte TX FIFO and RX FIFO to optimize the overall data throughput for various applications. The automatic RS485 control feature simplifies both the hardware and software for half-duplex RS-485 applications. If required, the multidrop (9-bit) mode feature further simplifies typical multidrop applications by enabling / disabling the UART receiver depending on the address byte received.

The multi-master capable I²C controller and EDGE controller (up to 32 GPIOs) can be accessed via the USB HID interface. The EDGE pins or I²C interface can be used for controlling and monitoring other peripherals. Up to 2 EDGE pins can be configured as a PWM generator.

FEATURES

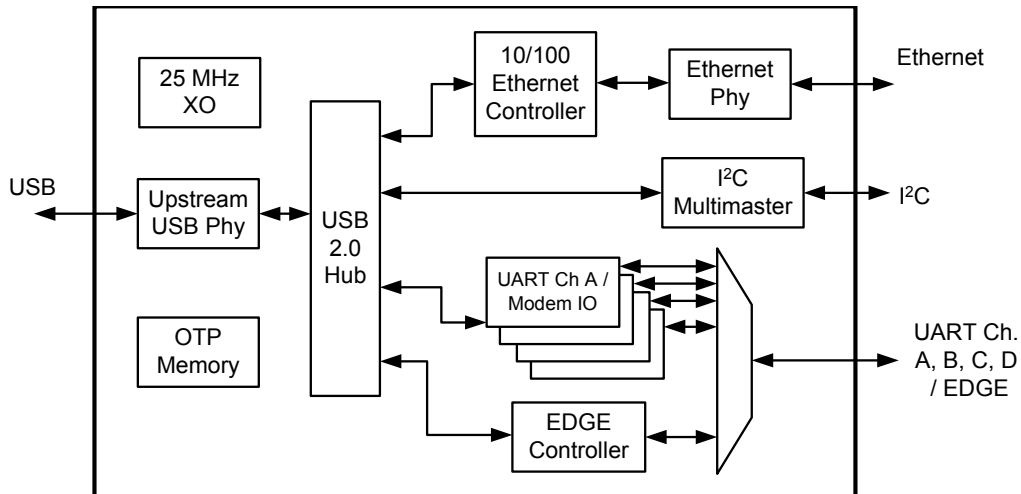

- USB 2.0 Compliant Interface
- 10/100 Ethernet Controller
- Enhanced UART
- Half-Duplex Mode
- I²C Multi-master
- Enhanced Dedicated GPIO Entity (EDGE)
- Single +5.0V Power Supply Input
- Regulated +3.3V Output Power
- Single 25MHz Crystal
- ±15kV HBM ESD Protection on USB data pins
- ±8kV HBM ESD Protection on all other pins

APPLICATIONS

- USB to Ethernet Dongles
- POS Terminals
- Test Instrumentation
- Networking
- Factory Automation and Process Controls
- Industrial Applications

Block Diagram

Extended Features

- USB 2.0 Compliant Interface
 - Integrated USB 2.0 PHY
 - Supports 480 Mbps USB Hi-Speed and 12 Mbps USB Full-Speed data rate
 - Supports USB suspend, resume and remote wakeup operations
 - Compatible with USB CDC-ECM and CDC-ACM
- 10/100 Ethernet Controller
 - Compliant with IEEE 802.3
 - Integrated 10/100 Ethernet MAC and PHY
 - 10BASE-T and 100BASE-TX support
 - Full-duplex and half-duplex support
 - Full-duplex and half-duplex flow control
 - Preamble generation and removal
 - Automatic 32-bit CRC generation and checking
 - Automatic payload padding and pad removal
 - Diagnostic loop-back modes
 - TCP/UDP/IP/ICMP checksum offload support
 - Flexible Address filtering modes
 - Wakeup packet support
 - Support for 2 status LEDs
- Enhanced UART features
 - Data rates up to 15 Mbps
 - Fractional Baud Rate Generator
 - 1024 byte TX and RX FIFOs
 - 7, 8 or 9 data bits, 1 or 2 stop bits
 - Automatic Hardware Flow Control
 - Automatic Software Flow Control
 - Multidrop (9-bit) mode
 - Auto RS-485 Half-Duplex Control
- I²C Multi-master
 - Up to 400 kbps transfers
 - Multi-master capable
- Enhanced Dedicated GPIO Entity (EDGE)
 - Parallel GPIO access
 - Two PWM generators
- Custom Ethernet software drivers
 - Windows 2000, XP, Vista, Win 7 and Win 8
 - Windows CE 5.0, 6.0, 7.0
 - Linux
 - OS X

Absolute Maximum Ratings

Stresses beyond the limits listed below may cause permanent damage to the device. Exposure to any Absolute Maximum Rating condition for extended periods may affect device reliability and lifetime.

V_{CC} Supply Voltage.....+5.75V

Input Voltage

(all pins except SCL, SDA, USBD+, USBD-).....-0.3 to +4.0V

Input Voltage (USBD+ and USBD-).....-0.3V to +5.75V

Input Voltage (SCL and SDA).....-0.3V to +6.0V

Junction Temperature.....125°C

Operating Conditions

Operating Temperature Range.....-40°C to +85°C

V_{CC} Supply Voltage.....+4.4V to +5.25V

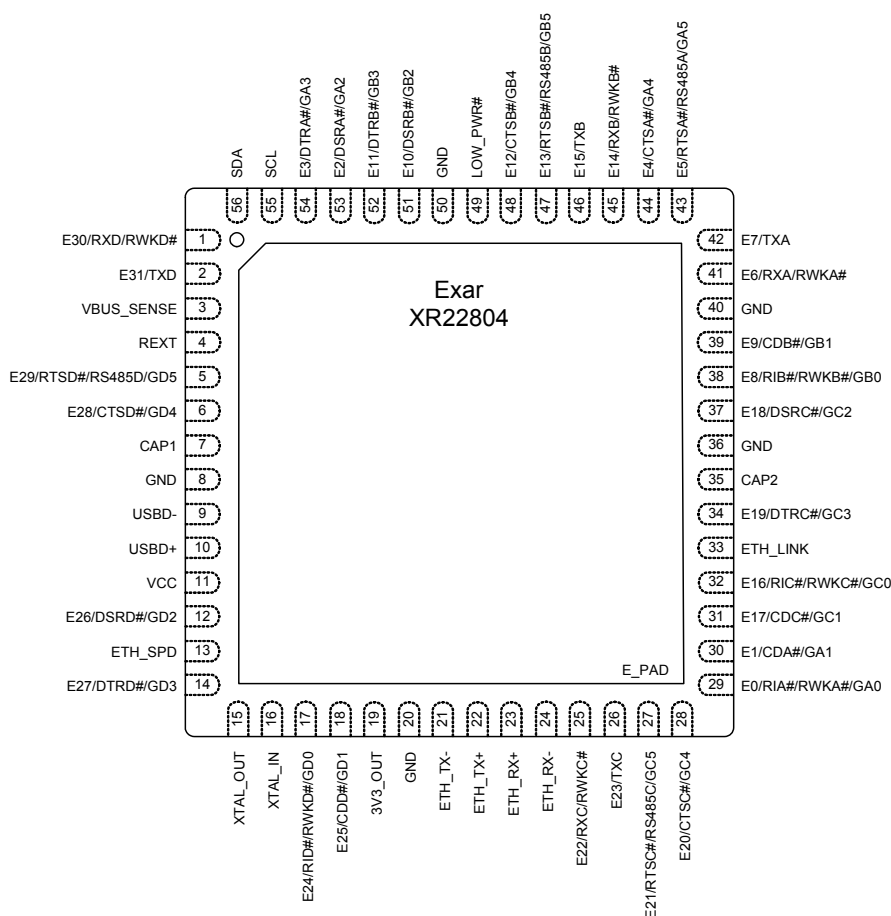

Electrical Characteristics

Unless otherwise noted: $T_A = -40^\circ\text{C}$ to $+85^\circ\text{C}$, $V_{CC} = 4.4\text{V}$ to 5.25V

Symbol	Parameter	Conditions	Min	Typ	Max	Units
Power Consumption						
I_{CC}	Operating Current	No load on GPIO pins or 3V3_OUT		185	250	mA
I_{SUSP}	Suspend Mode Current	No load on GPIO pins or 3V3_OUT		3	4.5	mA
UART, VBUS_SENSE, LOW_PWR# and EDGE Pins						
V_{IL}	Input Low Voltage		-0.3		0.8	V
V_{IH}	Input High Voltage		2.0		3.6	V
V_{OL}	Output Low Voltage	$I_{OL} = 4\text{mA}$			0.3	V
V_{OH}	Output High Voltage	$I_{OL} = -4\text{mA}$	2.2			V
I_{IL}	Input Low Leakage Current				± 10	μA
I_{IH}	Input High Leakage Current				± 10	μA
C_{IN}	Input Pin Capacitance				5	pF
USB I/O Pins						
V_{OL}	Output Low Voltage	Full-speed USB. External 15k Ω to GND on USBD+ and USBD- pins	0		0.3	V
V_{OH}	Output High Voltage	Full-speed USB. External 15k Ω to GND on USBD+ and USBD- pins	2.8		3.6	V
V_{OL}	Output Low Voltage	Hi-speed USB. External 45 Ω to GND on USBD+ and USBD- pins	-300		300	mV
V_{OH}	Output High Voltage	Hi-speed USB. External 45 Ω to GND on USBD+ and USBD- pins	360		440	mV
V_{DRVZ}	Driver Output Impedance			45		Ω
I_{OSC}	Output Short Circuit Current	1.5V on USBD+ and USBD- pins			52	mA

Pin Configuration

Pin Assignments

Pin No.	Pin Name	Type	Description
1	E30/RXD/RWKD#	I/O	Enhanced general purpose IO, or UART channel D RX data, or remote wakeup. Defaults to UART RX data.
2	E31/TXD	I/O	Enhanced general purpose IO, or UART channel D TX data. Defaults to UART TX data.
3	VBUS_SENSE	I	VBUS Sense input. In self-powered mode, the VBUS from the USB connector needs to be connected to this pin through a voltage divider circuit (VBUS = 5V, VBUS_SENSE = 3.3V input) using large resistance values to minimize power. It should also be decoupled by a 0.1uF capacitor. This feature must be enabled via the OTP whenever the hub function is configured for bus powered mode. The VBUS_SENSE input is used to disable the pull-up resistor on the USBD+ signal when VBUS is not present. In bus-powered mode, this pin is ignored.
4	REXT	I	Connect externally using short trace to 226 ohm 1% resistor to ground
5	E29/RTSD#/RS485D/GD5	I/O	Enhanced general purpose IO, or UART channel D Request to Send, or channel D auto-RS485 half-duplex enable, or general purpose IO. Defaults to UART GPIO input except when XR22804 is used with CDC-ACM driver. Refer to Automatic RTS/CTS Hardware Flow Control section on page 15 or Auto RS-485 Half-Duplex Control on page 16.
6	E28/CTSD#/GD4	I/O	Enhanced general purpose IO, or UART channel D Clear to Send, or general purpose IO. Defaults to UART GPIO input except when XR22804 is used with CDC-ACM driver. Refer to Automatic RTS/CTS Hardware Flow Control section on page 15.

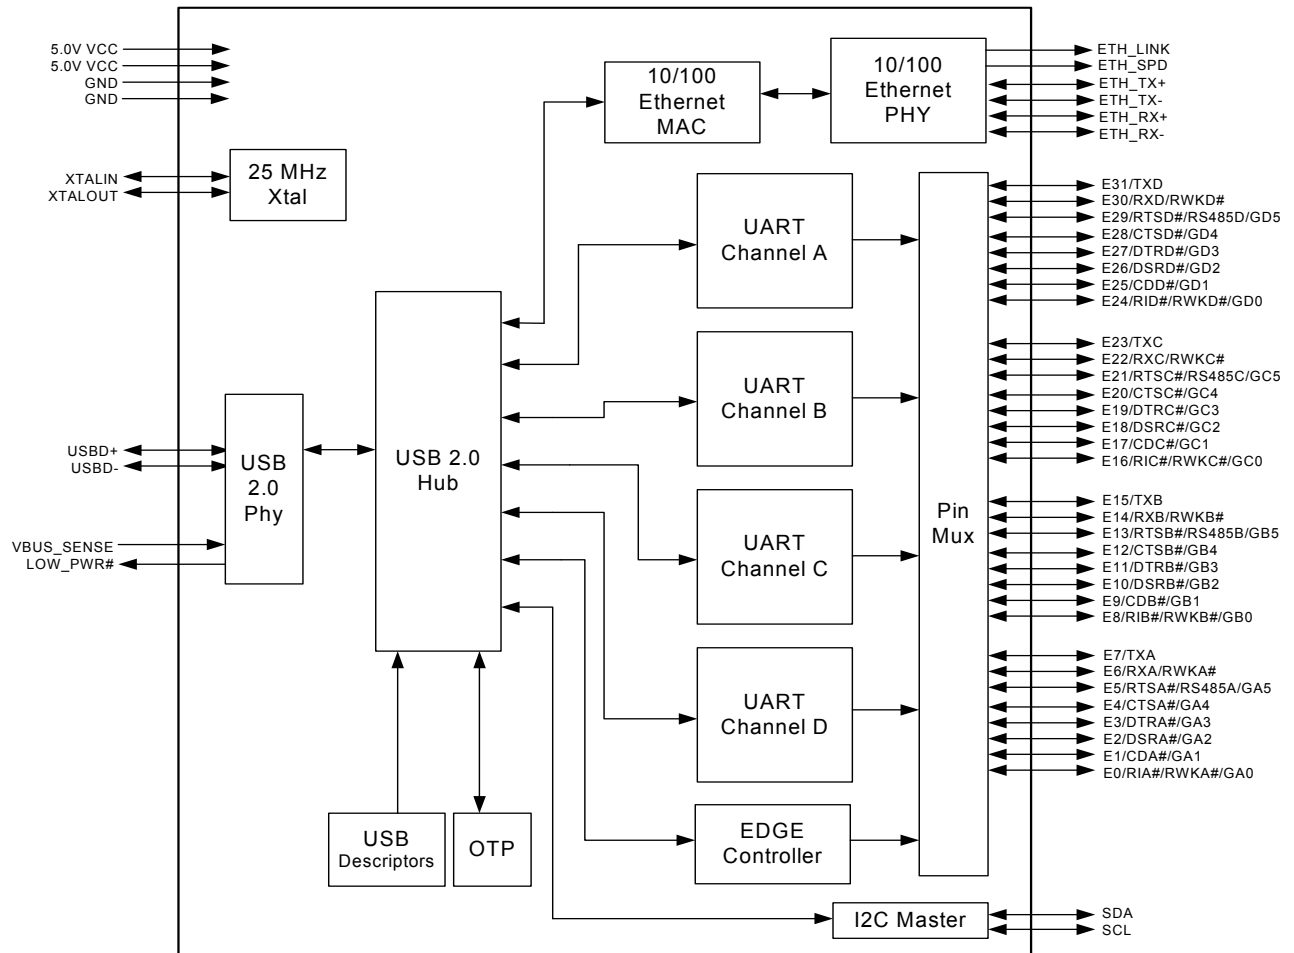

Pin No.	Pin Name	Type	Description
7	CAP1	I	Connect externally to CAP2 and 3V3_OUT using short trace
8	GND	PWR	Power supply common, ground
9	USBD-	I/O	USB port differential data negative
10	USBD+	I/O	USB port differential data positive
11	VCC	PWR	5.0V power supply input
12	E26/DSRD#/GD2	I/O	Enhanced general purpose IO, or UART channel D Data Set Ready, or general purpose IO. Defaults to UART GPIO input. Refer to Automatic DTR/DSR Hardware Flow Control section on page 16.
13	ETH_SPD	O	Ethernet 100 Mbps Speed Indicator
14	E27/DTRD#/GD3	I/O	Enhanced general purpose IO, or UART channel D Data Terminal Ready, or general purpose IO. Defaults to UART GPIO input. Refer to Automatic DTR/DSR Hardware Flow Control section on page 16.
15	XTALOUT	O	Crystal or buffered clock output
16	XTALIN	I	25 MHz +/- 50 ppm Crystal or external clock input
17	E24/RID#/RWKD#/GD0	I/O	Enhanced general purpose IO, or UART channel D Ring Indicator, or remote wakeup, or general purpose IO. Defaults to UART GPIO input. Refer to Remote Wakeup section on page 11.
18	E25/CDD#/GD1	I/O	Enhanced general purpose IO, or UART channel D Carrier Detect, or general purpose IO. Defaults to UART GPIO input.
19	3V3_OUT	PWR	3.3 V output power. Connect externally to CAP1 and CAP2 using short trace and decouple with minimum of 4.7uF capacitor
20	GND	PWR	Power supply common, ground
21	ETH_TX-	O	Ethernet transmit data out negative
22	ETH_TX+	O	Ethernet transmit data out positive
23	ETH_RX+	I	Ethernet receive data in positive
24	ETH_RX-	I	Ethernet receive data in negative
25	E22/RXC/RWKC#	I/O	Enhanced general purpose IO, or UART channel C RX data, or remote wakeup. Defaults to UART RX data.
26	E23/TXC	I/O	Enhanced general purpose IO, or UART channel C TX data. Defaults to UART TX data.
27	E21/RTSC#/RS485C/GC5	I/O	Enhanced general purpose IO, or UART channel C Request to Send, or channel C auto-RS485 half-duplex enable, or general purpose IO. Defaults to UART GPIO input except when XR22804 is used with CDC-ACM driver. Refer to Automatic RTS/CTS Hardware Flow Control section on page 15 or Auto RS-485 Half-Duplex Control on page 16.
28	E20/CTSC#/GC4	I/O	Enhanced general purpose IO, or UART channel D Clear to Send, or general purpose IO. Defaults to UART GPIO input except when XR22804 is used with CDC-ACM driver. Refer to Automatic RTS/CTS Hardware Flow Control section on page 15.
29	E0/RIA#/RWKA#/GA0	I/O	Enhanced general purpose IO, or UART channel A Ring Indicator, or remote wakeup, or general purpose IO. Defaults to UART GPIO input. Refer to Remote Wakeup section on page 11.
30	E1/CDA#/GA1	I/O	Enhanced general purpose IO, or UART channel A Carrier Detect, or general purpose IO. Defaults to UART GPIO input.
31	E17/CDC#/GC1	I/O	Enhanced general purpose IO, or UART channel C Carrier Detect, or general purpose IO. Defaults to UART GPIO input.
32	E16/RIC#/RWKC#/GC0	I/O	Enhanced general purpose IO, or UART channel C Ring Indicator, or remote wakeup, or general purpose IO. Defaults to UART GPIO input. Refer to Remote Wakeup section on page 11.

Pin No.	Pin Name	Type	Description
33	ETH_LINK	O	Ethernet 10/100 Activity Indicator
34	E19/DTRC#/GC3	I/O	Enhanced general purpose IO, or UART channel C Data Terminal Ready, or general purpose IO. Defaults to UART GPIO input. Refer to Automatic DTR/DSR Hardware Flow Control section on page 16
35	CAP2	I	Connect externally to CAP1 and 3V3_OUT using short trace
36	GND	PWR	Power supply common, ground
37	E18/DSRC#/GC2	I/O	Enhanced general purpose IO, or UART channel C Data Set Ready, or general purpose IO. Defaults to UART GPIO input. Refer to Automatic DTR/DSR Hardware Flow Control section on page 16.
38	E8/RIB#/RWKB#/GB0	I/O	Enhanced general purpose IO, or UART channel B Ring Indicator, or remote wakeup, or general purpose IO. Defaults to UART GPIO input. Refer to Remote Wakeup section on page 11.
39	E9/CDB#/GB1	I/O	Enhanced general purpose IO, or UART channel B Carrier Detect, or general purpose IO. Defaults to UART GPIO input.
40	GND	PWR	Power supply common, ground
41	E6/RXA/RWKA#	I/O	Enhanced general purpose IO, or UART channel A RX data, or remote wakeup. Defaults to UART RX data.
42	E7/TXA	I/O	Enhanced general purpose IO, or UART channel A TX data. Defaults to UART TX data.
43	E5/RTSA#/RS485A/GA5	I/O	Enhanced general purpose IO, or UART channel A Request to Send, or auto-RS485 half-duplex enable, or general purpose IO. Defaults to UART GPIO input except when XR22804 is used with CDC-ACM driver. Refer to Automatic RTS/CTS Hardware Flow Control section on page 15 or Auto RS-485 Half-Duplex Control on page 16.
44	E4/CTSA#/GA4	I/O	Enhanced general purpose IO, or UART channel A Clear to Send, or general purpose IO. Defaults to UART GPIO input except when XR22804 is used with CDC-ACM driver. Refer to Automatic RTS/CTS Hardware Flow Control section on page 15.
45	E14/RXB/RWKB#	I/O	Enhanced general purpose IO, or UART channel B RX data, or remote wakeup. Defaults to UART RX data.
46	E15/TXB	I/O	Enhanced general purpose IO, or UART channel B TX data. Defaults to UART TX data.
47	E13/RTSB#/RS485B/GB5	I/O	Enhanced general purpose IO, or UART channel B Request to Send, or channel B auto-RS485 half-duplex enable, or general purpose IO. Defaults to UART GPIO input except when XR22804 is used with CDC-ACM driver. Refer to Automatic RTS/CTS Hardware Flow Control section on page 15 or Auto RS-485 Half-Duplex Control on page 16.
48	E12/CTSB#/GB4	I/O	Enhanced general purpose IO, or UART channel B Clear to Send, or general purpose IO. Defaults to UART GPIO input except when XR22804 is used with CDC-ACM driver. Refer to Automatic RTS/CTS Hardware Flow Control section on page 15.
49	LOW_PWR#	O	The LOW_PWR# pin will be asserted whenever it is not safe to draw the amount of current requested from VBUS in the Device Maximum Power field of the Configuration Descriptor. The LOW_PWR# pin is asserted when the XR22804 is in suspend mode or when it is not yet configured. The LOW_PWR# pin will be de-asserted whenever it is safe to draw the amount of current requested in the Device Maximum Power field. Note that the XR22804 device is a high power device. The default polarity of the LOW_PWR# output pin is active low and is programmable via the OTP.
50	GND	PWR	Power supply common, ground
51	E10/DSRB#/GB2	I/O	Enhanced general purpose IO, or UART channel B Data Set Ready, or general purpose IO. Defaults to UART GPIO input. Refer to Automatic DTR/DSR Hardware Flow Control section on page 16.

Pin No.	Pin Name	Type	Description
52	E11/DTRB#/GB3	I/O	Enhanced general purpose IO, or UART channel B Data Terminal Ready, or general purpose IO. Defaults to UART GPIO input. Refer to Automatic DTR/DSR Hardware Flow Control section on page 16
53	E2/DSRA#/GA2	I/O	Enhanced general purpose IO, or UART channel A Data Set Ready, or general purpose IO. Defaults to UART GPIO input. Refer to Automatic DTR/DSR Hardware Flow Control section on page 16.
54	E3/DTRA#/GA3	I/O	Enhanced general purpose IO, or UART channel A Data Terminal Ready, or general purpose IO. Defaults to UART GPIO input. Refer to Automatic DTR/DSR Hardware Flow Control section on page 16.
55	SCL	I/O OD	I ² C Master controller serial clock (open-drain) External pull-up resistor required on this pin.
56	SDA	I/O OD	I ² C Master controller data (open-drain). External pull-up resistor required on this pin.

Type: I = Input, O = Output, I/O = Input/Output, PWR = Power, OD = Open-Drain

Functional Block Diagram

Functional Description

USB Interface

The XR22804 is a USB compound device with an embedded hub and 7 downstream functions. The downstream functions of the XR22804 are 10/100 Ethernet, 4 UART functions, an I2C function, and an Enhanced Dedicated GPIO Entity (EDGE) function. The upstream USB interface of the XR22804 is compliant with both USB 2.0 full and hi-speed specifications. All functions downstream of the hub are hi-speed functions.

The XR22804 will have a single vendor ID and vendor string. Each function in the XR22804 will have an individual product string and serial string. The default serial number strings will be based upon the uniquely assigned Ethernet MAC address for each XR22804 device. The serial strings for multiple functions within the same device will differ only by a single character which will be assigned a value between 0 and 7. All string and ID values can be overridden via OTP.

The XR22804 can be placed into a low power or suspended state by the USB host. By default the XR22804 hub is configured for bus powered mode with a maximum power of 250 mA. All other functions in the XR22804 are configured for self-powered mode. In bus powered mode, the Ethernet Phy must be powered down during suspended state to meet USB suspend power requirements. The Ethernet Phy may remain enabled to support Ethernet remote wakeup during suspend if the OTP is modified to report the hub function as self-powered in the USB descriptors. See Ethernet Remote Wakeup section on page 13.

Each function of the XR22804 supports one configuration and utilizes the following USB endpoints:

- USB hub
 - Control endpoint
 - Interrupt-in endpoint
- Ethernet function
 - Control endpoint
 - Interrupt-in endpoint
 - Bulk-in and bulk-out endpoints
- I²C function
 - Control endpoint
 - Interrupt-in and interrupt-out endpoints
- EDGE Controller function
 - Control endpoint
 - Interrupt-in and interrupt-out endpoints
- UART function
 - Control endpoint
 - Interrupt-in endpoint
 - Bulk-in and bulk-out endpoints

USB Vendor ID

Exar's USB vendor ID is 0x04E2. This is the default vendor ID that is used for the XR22804. Companies may obtain their own vendor ID, by becoming members of USB.org. The XR22804 OTP can then be modified to report this vendor ID in the USB descriptors.

USB Product ID

Each function in the XR22804 has an individual USB product ID. The default product IDs for each of the functions are shown in Table 1. These values can be modified by programming the OTP. Companies using their own vendor ID may also

select their own product IDs. Additionally, upon request Exar will provide a selection of different product IDs for use with Exar's vendor ID for companies that do not wish to become members of USB.org, but wish to use their own product ID.

Table 1: Default XR22804 Product IDs

XR22804 Function	Default Product ID
Hub	0x0801
Ethernet 10/100	0x1300
UART Channel A	0x1400
UART Channel B	0x1401
UART Channel C	0x1402
UART Channel D	0x1403
I ² C	0x1100
EDGE	0x1200

USB Suspend

All USB peripheral devices must support the USB suspend mode. Per USB standard, the XR22804 device will begin to enter the suspend state if it does not detect any activity, (including Start of Frame or SOF packets) on its USB data lines for 3 ms. The peripheral device must then reduce power consumption from VBUS power within the next 7 ms to the allowed limit of 2.5 mA per function for the suspended state. Because the XR22804 is a compound device with 8 functions, the suspend state power limit is 20 mA for the device. Note that in this context, the "device" is all circuitry (including the XR22804) that draws power from the host VBUS.

Remote Wakeup

When the XR22804 is suspended, the E0/RIA#/RWKA#/GA0, E8/RIB#/RWKB#/GB0, E16/RIC#/RWKC#/GC0 or the E24/RID#/RWKD#/GD0 pins may be used to request that the host exit the suspend state if configured as an input. A high to low transition on any of these pins may be used to signal a remote wakeup request to the host via Exar's custom driver. However, because the four pins are internally logically ANDed, a logic '0' on any of the four inputs will prevent the resume signaling. Note that the CDC-ACM driver does not support the remote wakeup feature. The E0/RIA#/RWKA#/GA0, E8/RIB#/RWKB#/GB0, E16/RIC#/RWKC#/GC0 or the E24/RID#/RWKD#/GD0 pins may be used to signal remote wakeup by default. Additionally, the E6/RXA/RWKA#, E14/RXB/RWKB#, E22/RXC/RWKC# or E30/RXD/RWKD# pins, if configured as an input, may also be used for remote wakeup if enabled using the REMOTE_WAKEUP register. The Ethernet function in the XR22804 can also be used for remote wakeup under certain conditions. Refer to Ethernet Remote Wakeup on page 13.

USB Strings

USB specifies three character string descriptors that are provided to the USB host during enumeration in string descriptors: the manufacturer, product and serial strings. In a compound device such as the XR22804, each function provides these strings to the USB host. The default manufacturer string for the XR22804 device is "Exar Corp.". The default product strings for the hub, Ethernet function, UART functions, I²C function and EDGE function are shown in Table 2. The serial number string is a unique alpha-numeric ASCII string programmed into the device at the factory.

Table 2: Default XR22804 Product Strings

XR22804 Function	Default Product String
Hub	Exar's XR22804 Hub
Ethernet 10/100	Exar USB Ethernet

Table 2: Default XR22804 Product Strings

XR22804 Function	Default Product String
UARTs	Exar USB UART
I ² C	Exar USB I2C
EDGE	Exar USB EDGE

The OTP may be used to override these strings. However, to ensure unique serial numbers for each device, it is recommended that the factory pre-programmed serial number string be used and not be overwritten via OTP.

USB Device Drivers

Each of the functions in the XR22804 require a USB device driver for operation. Both the I²C and EDGE functions conform to the HID device class and as such, utilize the embedded HID driver that is native to each Operating System. The Ethernet function conforms to the CDC device class and as such can utilize an embedded CDC-ECM driver. However, at the time of this writing, none of the Microsoft OS provide support for CDC-ECM embedded drivers. Both Linux and Mac OS-X platforms do support CDC-ECM drivers.

The CDC-ECM is a "standard" driver which implements functionality on a specific class of devices. They operate without any ability to access device specific register sets. In some cases, this can limit the functionality and / or throughput capability of the XR22804. Exar provides a custom Ethernet device driver which has been optimized for the best possible data through-put in Windows and Linux platforms. This custom driver also allows for access to the device register set and thus full control of the XR22804 device functionality. Refer to 10/100 Ethernet section on page 12 for more details.

The UART function can be used with either a standard CDC-ACM driver or a custom driver. When the CDC-ACM driver is used, the driver has no ability to read or write the XR22804 device registers. Because of this, the XR22804 device is initialized to the settings in Table 3. With a custom driver, all GPIOs default in hardware to inputs but these settings may be modified by a custom driver.

Table 3: XR22804 Register Defaults With CDC-ACM Driver

Register	Value	Notes
Flow Control	0x001	Hardware Flow Control
GPIO_MODE	0x001	RTS / CTS Flow Control
GPIO_DIRECTION	0x008	E3/DTR#/G3
GPIO_INT_MASK	0x030	E0/RI#/RWK#/G0, E1/CD#/G1 and E2/DSR#/G2 are interrupt sensitive, i.e. can cause a USB interrupt to be generated

These default settings can be overridden by programming the OTP.

If a custom driver is used, the CUSTOM_DRIVER_ACTIVE bit should be immediately set to '1' by the USB UART driver. Once the CUSTOM_DRIVER_ACTIVE bit is set, the custom driver can use standard CDC-ACM commands without configuring the device to the default register settings used with the CDC-ACM driver. Any changes to the register settings for the GPIOs and flow control will specifically need to be configured by the driver / application software. Although there is no ability to read / write registers when using the CDC-ACM driver, basic UART functions, including setting baud rate, character format and sending line break is supported by the CDC driver. Refer to the 4 CDC_ACM_IF USB Control Commands listed in Table 4.

10/100 Ethernet

The Ethernet port is a 10/100 Ethernet MAC and Phy compliant with IEEE 802.3. The Ethernet port supports speed / duplex auto-negotiation, auto-MDIX, 10 Mbps data auto-polarity, full and half duplex data rates at 10 and 100 Mbps, generates and validates the 32-bit FCS, and performs unicast and multicast filtering. The XR22804 also performs TCP, UDP and

ICMP checksum offload over IPV4 and IPV6 as well as header checksum offload in IPV4. On chip RAM provides all required packet buffering.

In Windows OS, using the Exar custom Ethernet driver, the properties dialog, advanced properties can be used to set the pause frame flow control, speed and duplex, auto-negotiation, checksum offload, and Ethernet remote wakeup settings. By default, the Ethernet MAC will honor incoming pause frames sent by a peer Ethernet device, but will not generate pause frames. Auto-MDIX is always enabled.

Ethernet Remote Wakeup

If the XR22804 hub is configured as a self-powered device and has Ethernet remote wakeup enabled, the XR22804 will request the USB host to resume in response to a magic packet or a link state change on the Ethernet port. When the USB host is suspended, the Ethernet Phy remains active and the XR22804 is able to both meet USB suspend mode power requirements as well as respond to magic packet and link state changes.

The magic packet is an Ethernet packet with specific content, i.e. 6 bytes of 0xFF, followed by 16 repetitions of the target MAC address (MAC address of the XR22804 device). This content can occur anywhere in the incoming packet payload. The link state change will wake the USB host if the link is down when the USB host is suspended and then the link goes up, or if the link is up when the USB host is suspended and then the link goes down.

UART

The UART can be configured via USB control transfers from the USB host. The UART transmitter and receiver sections are described separately in the following sections. At power-up, the XR22804 will default to 9600 bps, 8 data bits, no parity bit, 1 stop bit, and no flow control. If a standard CDC-ACM driver accesses the XR22804, defaults will change. See Remote Wakeup section on page 11.

UART transmitter

The transmitter consists of a 1024-byte TX FIFO and a Transmit Shift Register (TSR). Once a bulk-out packet has been received and the CRC has been validated, the data bytes in that packet are written into the TX FIFO of the specified UART channel. Data from the TX FIFO is transferred to the TSR when the TSR is idle or has completed sending the previous data byte. The transmitter sends the start bit followed by the data bits (starting with the LSB), inserts the proper parity-bit if enabled, and adds the stop-bit(s). The transmitter can be configured for 7 or 8 data bits with or without parity or 9 data bits without parity. If 9 bit data is selected without wide mode, the 9th bit will always be '0'.

UART transmitter - Wide mode

When both 9 bit data and wide mode are enabled, two bytes of data must be written. The first byte that is loaded into the TX FIFO are the first 8 bits (data bits 7-0) of the 9-bit data. Bit-0 of the second byte that is loaded into the TX FIFO is bit-8 of the 9-bit data. The data that is transmitted on the TX pin is as follows: start bit, 9-bit data, stop bit. Use the TX_WIDE_MODE register to enable transmit wide mode.

UART receiver

The receiver consists of a 1024-byte RX FIFO and a Receive Shift Register (RSR). Data that is received in the RSR via the RX pin is transferred into the RX FIFO. Data from the RX FIFO is sent to the USB host in response to a bulk-in request. Depending on the mode, error / status information for that data character may or may not be stored in the RX FIFO with the data.

UART receiver - Normal mode with 7 or 8-bit data

Data that is received is stored in the RX FIFO. Any parity, framing or overrun error or break status information related to the data is discarded. Receive data format is shown in Figure 1.

UART receiver - Normal mode with 9-bit data

The first 8 bits of data received is stored in the RX FIFO. The 9th bit as well as any parity, framing or overrun error or break status information related to the data is discarded.

Figure 1: UART Normal Receive Data Format with 7 or 8-bit data

UART receiver - Wide mode with 7 or 8-bit data

Two bytes of data are loaded into the RX FIFO for each byte of data received. The first byte is the received data. The second byte consists of the error bits and break status. Wide mode receive data format is shown in Figure 2. Use the RX_WIDE_MODE register to enable receive wide mode.

UART receiver - Wide mode with 9-bit data

Two bytes of data are loaded into the RX FIFO for each byte of data received. The first byte is the first 8 bits of the received data. The 9th bit received is stored in the bit 0 of the second byte. The parity bit is not received / checked. The remainder of the 2nd byte consists of the framing and overrun error bits and break status.

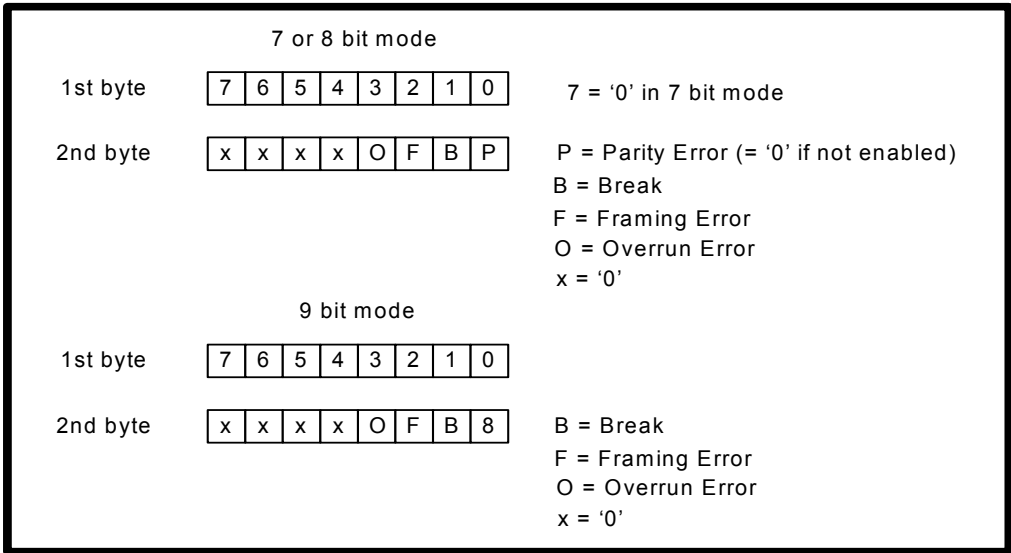

Figure 2: UART Receive Wide Mode Data Format with 7, 8 or 9-bit data

Error flags are also available from the ERROR_STATUS register and the interrupt packet, however these flags are historical flags indicating that an error has occurred since the previous request. Therefore, no conclusion can be drawn as to which specific byte(s) may have contained an actual error in this manner.

RX FIFO Low Latency

In normal operation all bulk-in transfers will be of maxPacketSize bytes (512 bytes in hi-speed mode and 64 bytes in full-speed mode) to improve throughput and to minimize host processing. When there are 512 / 64 bytes of data in the RX FIFO, the XR22804 will acknowledge a bulk-in request from the host and transfer the data packet. If there is less than 512 bytes in

the RX FIFO, the XR22804 may NAK the bulk-in request indicating that data is not ready to transfer at that time. However, if there is less than 512 bytes in the RX FIFO and no data has been received for more than 3 character times, the XR22804 will acknowledge the bulk-in request and transfer any data in the RX FIFO to the USB host.

In some cases, especially when the baud rate is low, this increases latency unacceptably. The XR22804 has a low latency register bit that will cause the XR22804 to immediately transfer any received data in the RX FIFO to the USB host, i.e. it will not wait for 3 character times. The custom driver may automatically set the RX_CONTROL register to force the XR22804 to be in the low latency mode, or the user may manually set this bit. With the CDC-ACM driver, the low latency mode is automatically set whenever the baud rate is set to a value of less than 46921 bps using the CDC_ACM_IF_SET_LINE_CODING command.

GPIO

There can be up to 8 GPIO pins in the XR22804 UART including the UART RX and TX pins. These GPIO pins may be configured as UART GPIO, or for other UART functions, e.g. RTS# function, or be assigned to the EDGE. Refer to Enhanced Dedicated GPIO Entity section on page 17.

Automatic RTS / CTS hardware flow control

E5/RTS#/RS485/G5 and E4/CTS#/G4 of the UART channel may be enabled as the RTS# and CTS# signals for Auto RTS/CTS flow control when GPIO_MODE[2:0] = '001' and FLOW_CONTROL[2:0] = '001'. Automatic RTS flow control is used to prevent data overrun errors in local RX FIFO by de-asserting the RTS signal to the remote UART. When there is room in the RX FIFO, the RTS pin will be re-asserted. Automatic CTS flow control is used to prevent data overrun to the remote RX FIFO. The CTS# input is monitored to suspend / restart the local transmitter (see Figure 3):

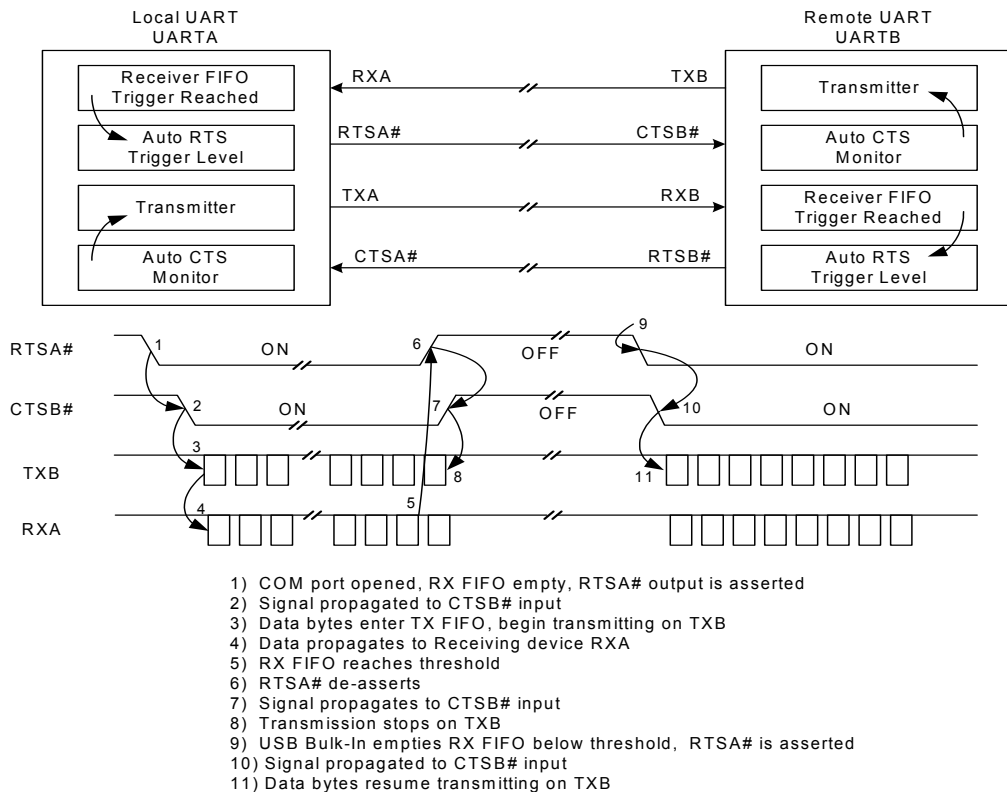

Figure 3: Auto RTS / CTS Hardware Flow Control

Automatic DTR / DSR hardware flow control

Auto DTR/DSR hardware flow control behaves the same as the Auto RTS/CTS hardware flow control described above except that it uses the DTR# and DSR# signals. For Auto hardware flow control, `FLOW_CONTROL[2:0] = '001'`: E3/DTR#/G3 and E2/DSR#/G2 become DTR# and DSR#, respectively, when `GPIO_MODE[2:0] = '010'`.

Automatic XON / XOFF software flow control

When software flow control is enabled, the XR22804 compares the receive data characters with the programmed Xon or Xoff characters. If the received character matches the programmed Xoff character, the XR22804 will halt transmission as soon as the current character has completed transmission. Data transmission is resumed when a received character matches the Xon character. Software flow control is enabled when `FLOW_CONTROL[2:0] = '010'`.

Automatic RS-485 half duplex control

The Auto RS-485 Half-Duplex Control feature changes the behavior of the E5/RTS#/RS485/G5 pin when enabled by the `GPIO_MODE` register bits 2-0. See `GPIO_MODE` Register Description on page 24. The `FLOW_CONTROL` register must also be set appropriately for use in multidrop applications. See `FLOW_CONTROL` Register Description on page 22. If enabled, the transmitter automatically asserts the E5/RTS#/RS485/G5 output prior to sending the data. By default, it de-asserts E5/RTS#/RS485/G5 following the last stop bit of the last character that has been transmitted, but the `RS485_DELAY` register may be used to delay the deassertion. The polarity of the E5/RTS#/RS485/G5 signal can also be modified using the `GPIO_MODE` register bit 3.

Multidrop mode with address matching

The XR22804 device has two address matching modes which are also set by the flow control register using modes 3 and 4. These modes are intended for a multi-drop network application. In these modes, the `XON_CHAR` register holds a unicast address and the `XOFF_CHAR` holds a multicast address. A unicast address is used by a transmitting master to broadcast an address to all attached slave devices that is intended for only one slave device. A multicast address is used to broadcast an address intended for more than one recipient device. Each attached slave device should have a unique unicast address value stored in the `XON_CHAR` register, while multiple slaves may have the same multicast address stored in the `XOFF_CHAR` register. An address match occurs when an address byte (9th bit or parity bit is '1') is received that matches the value stored in either the `XON_CHAR` or `XOFF_CHAR` register.

Multidrop mode receiver

If an address match occurs in either flow control mode 3 or 4, the UART Receiver will automatically be enabled and all subsequent data bytes will be loaded into the RX FIFO. The UART Receiver will automatically be disabled when an address byte is received that does not match the values in the `XON_CHAR` or `XOFF_CHAR` register.

Multidrop mode transmitter

In flow control mode 3, the UART transmitter is always enabled, irrespective of the RX address match. In flow control mode 4, the UART transmitter will only be enabled if there is an RX address match.

Programmable Turn-Around Delay

By default, the E5/RTS#/RS485/G5 pin will be de-asserted immediately after the stop bit of the last byte has been shifted. However, this may not be ideal for systems where the signal needs to propagate over long cables. Therefore, the de-assertion of E5/RTS#/RS485/G5 pin can be delayed from 1 to 15 bit times via the `RS485_DELAY` register to allow for the data to reach distant UARTs.

Half-duplex mode

Half-duplex mode is enabled when `FLOW_CONTROL[3] = 1`. In this mode, the UART will ignore any data on the RX input when the UART is transmitting data.

EDGE - Enhanced Dedicated GPIO Entity

The XR22804 has 32 IO pins that may be assigned to the EDGE. By default, these pins are all assigned to the UART channel A, channel B, channel C, and channel D functions, either to the UART data and / or flow control pins or to the UART GPIO. Note that UART GPIO and EDGE have separate register controls. Pins assigned to the UART function cannot be controlled by the EDGE registers and vice versa. To assign pins to the EDGE, use the EDGE_FUNC_SEL_0 and EDGE_FUNC_SEL_1 registers. See EDGE_FUNC_SEL_0 and EDGE_FUNC_SEL_1 register descriptions on page 37 and page 40.

The EDGE controller allows for GPIO signals to be individually set or cleared or to be grouped, such that the all pins in the group can be simultaneously accessed for reads or writes. Note that on write accesses, output pins will change in 4-bit sub-groups on core clock (60 MHz) boundaries. For example, if an 8 bit data group is defined and the data value is written from 0x00 to 0xFF, 4 bits would change from '0' to '1' followed by the next 4 bits one clock cycle (~ 17 ns) later.

EDGE IOs can be configured as inputs or outputs. Outputs can be configured as push-pull or open drain and can be tri-stated. Inputs can be configured to generate interrupts to the USB host on either negative or positive edge transitions.

Another feature of the EDGE controller is that up to 2 GPIO pins within the EDGE can be assigned to pulse width modulated (PWM) outputs. Each of the PWM outputs can be used to generate an output clock or pulse of varying duty cycle. Both low and high cycles can be configured in steps of 267 ns up to 1.092 ms. The output can be controlled to generate a single "one-shot" pulse or to free run. Refer to the EDGE_PWM0_CTRL and EDGE_PWM1_CTRL registers on page 43 for control of PWM outputs.

I²C

The XR22804 implements an I²C multi-master using the control endpoint of the full-speed USB function to transfer data to and from the I²C interface. The I²C master supports both standard (100 kbps) and fast (400 kbps) modes and supports multiple master configurations to allow other devices to access slave devices on the I²C. The I²C function is an HID function and uses the native HID driver. It supports both 7 and 10 bit addressing modes.

Regulated 3.3V Power Output

The XR22804 internal voltage regulator provides 3.3 VDC output power which can be utilized by other circuitry. Refer to Electrical Characteristics on page 3 for maximum power capability. For bus powered devices, significant utilization of the 3V3 output power may require increasing the maximum power request above the 250 mA default value from the USB host by programming the OTP.

OTP

The OTP is an on-chip non-volatile memory, that is one-time programmable via the USB interface. Bit locations within the memory may be programmed at various times allowing for customization of the XR22804. Some bits are pre-programmed at the factory and caution must be taken not to program any locations except user defined addresses. Contact the factory uarttechsupport@exar.com for information and assistance in programming the XR22804 OTP.

USB Control Commands

The following table shows all of the USB Control Commands that are supported by the XR22804. Commands include standard USB commands, USB class specific CDC-ACM commands and USB vendor specific Exar commands.

Table 4: Supported USB Control Commands

Name	Request Type	Request	Value		Index		Length		Description
			LSB	MSB	LSB	MSB	LSB	MSB	
DEV GET_STATUS	0x80	0x0	0x0	0x0	0x0	0x0	0x2	0x0	Device: remote wake-up + self-powered
IF GET_STATUS	0x81	0x0	0x0	0x0	0x0	0x0	0x2	0x0	Interface: zero
EP GET_STATUS	0x82	0x0	0x0	0x0	0x0, 0x4, 0x84	0x0	0x2	0x0	Endpoint: halted
DEV CLEAR_FEATURE	0x00	0x1	0x1	0x0	0x0	0x0	0x0	0x0	Device remote wake-up
EP CLEAR_FEATURE	0x02	0x1	0x0	0x0	0x0, 0x4, 0x84	0x0	0x0	0x0	Endpoint halt
DEV SET_FEATURE	0x00	0x3	0x1	0x0	0x0	0x0	0x0	0x0	Device remote wake-up
EP SET_FEATURE	0x02	0x3	0x0	0x0	0x0, 0x4, 0x84	0x0	0x0	0x0	Endpoint halt
SET_ADDRESS	0x00	0x5	addr	0x0	0x0	0x0	0x0	0x0	addr = 1 to 127
GET_DESCRIPTOR	0x80	0x6	0x0	0x1	0x0	0x0	len MSB	len MSB	Device descriptor
GET_DESCRIPTOR	0x80	0x6	0x0	0x2	LangID	LangID	len MSB	len MSB	Configuration descriptor
GET_DESCRIPTOR	0x80	0x6	0x0	0x3	0x0	0x0	len MSB	len MSB	String descriptor
GET_CONFIGURATION	0x80	0x8	0x0	0x0	0x0	0x0	0x1	0x0	
SET_CONFIGURATION	0x00	0x9	n	0x0	0x0	0x0	0x0	0x0	n = 0, 1
CDC_ACM_IF SET_LINE_CODING	0x21	0x32	0x0	0x0	0x0	0x0	0x7	0x0	Set the UART baud rate, parity, stop bits, etc.
CDC_ACM_IF GET_LINE_CODING	0xA1	0x33	0x0	0x0	0x0	0x0	0x7	0x0	Get the UART baud rate, parity, stop bits, etc.
CDC_ACM_IF SET_CONTROL_LINE_STATE	0x21	0x34	0x0	0x0	0x0	0x0	0x7	0x0	Set/Clear DTR in CDC-ACM mode.
CDC_ACM_IF SEND_BREAK	0x21	0x35	val LSB	val MSB	0x0	0x0	0x0	0x0	Send a break for the specified duration.
XR_GET_CHIP_ID	0xC0	0xFF	0x0	0x0	0x0	0x0	0x6	0x0	Get Exar VID (2 bytes), PID (2 bytes) and bcdDevice (2 bytes)

Table 4: Supported USB Control Commands

Name	Request Type	Request	Value		Index		Length		Description
			LSB	MSB	LSB	MSB	LSB	MSB	
XR_SET_REG See Table 5	0x41	0x0	write-data LSB	write-data MSB	write addr	0x0	0x0	0x0	Vendor specific register access.
XR_GET_REG See Table 5	0xC1	0x0	0x0	0x0	read addr	0x0	0x2	0x0	Vendor specific register access.

UART Registers

UART registers are accessible via the USB interface using the XR_SET_REG and XR_GET_REG USB commands. Note that all addresses not listed in this table are reserved or undefined. Upper byte (bits 15:8) not shown in table are also reserved and should remain 0x00. Writing to any register other than those defined in Table 5 may result in undefined behavior of the device. The addresses for each of UARTs in the XR22804 are the same. Because each UART is assigned a unique USB address during enumeration by the USB host, a GUI connected to a specific COM port will be directed via the driver to the appropriate UART channel.

UART Register Map

Table 5: XR22804 Register Map

Address	Register Name	Bit 7 (15)	Bit 6 (14)	Bit 5 (13)	Bit 4 (12)	Bit 3 (11)	Bit 2 (10)	Bit 1 (9)	Bit 0 (8)

UART Register Descriptions

Note that all register reset default values are '0' unless otherwise specified. All registers are 16 bits.

UART_ENABLE (0x040) - Read/Write

Bit	Default	Description
15:2	0x0000	Reserved These bits are reserved and should be written as '0'.
1	0	RX 0: Disable UART RX 1: Enable UART RX
0	0	TX 0: Disable UART TX 1: Enable UART TX

FORMAT (0x045) - Read/Write

Note that the CDC_SET_LINE_CODING command may be used to set the UART data format in addition to this registers.

Bit	Default	Description
15:8	0x00	Reserved These bits are reserved and should be written as '0'.

Bit	Default	Description
7	0	Stop 0: 1 stop bit 1: 2 stop bits
6:4	0	Parity 000: No parity 001: Odd parity 010: Even parity 011: Mark parity 100: Space parity All other values undefined, do not use.
3:0	0x8	Data_Bits 0111: 7-bit characters 1000: 8-bit characters 1001: 9-bit characters All other values undefined, do not use.

FLOW_CONTROL (0x046) - Read/Write

Bit	Default	Description
15:4	0x000	Reserved These bits are reserved and should be written as '0'.
3	0	Auto_RS485 0: Automatic RS-485 mode is disabled 1: Automatic RS-485 mode is enabled
2:0	0	Mode 000: None 001: Hardware 010: Software 011: Address match RX 100: Address match RX and TX All other values undefined, do not use.

XON_CHAR (0x047) - Read/Write

Bit	Default	Description
15:8	0x00	Reserved These bits are reserved and should be written as '0'.
7:0	0x11	Char XON ASCII character received in hexadecimal format

XOFF_CHAR (0x048) - Read/Write

Bit	Default	Description
15:8	0x00	Reserved These bits are reserved and should be written as '0'.
7:0	0x13	Char XOFF ASCII character received in hexadecimal format

ERROR_STATUS (0x049) - Read Only

Bit	Default	Description
15:8	0x00	Reserved These bits are reserved and should be written as '0'.
7	0	Break_Active 0: No break condition currently active 1: Break condition currently active
6	0	Overrun 0: No overrun error detected 1: Overrun error detected since last register read
5	0	Parity 0: No parity error detected 1: Parity error detected since last register read
4	0	Frame 0: No frame error detected 1: Frame error detected since last register read
3	0	Break 0: No break error detected 1: Break error detected since last register read
2:0	0	Reserved These bits are reserved and should be written as '0'.

TX_BREAK (0x04A) - Read/Write

Bit	Default	Description
15:0	0x0000	Value This register controls transmission of break signal. Writing a non-zero value "N" to this registers causes the XR22804 to send a break signal on the UART TX pin for "N" ms, for $0 < N < 0xFFFF$. A counter will decrement this value at 1 ms intervals until the count reaches 0x0 at which time the break signal will stop being sent. Writing a value of 0xFFFF causes a continuous break signal to be sent, until either a value of 0x0 is written or another non-zero value other than 0xFFFF which will again cause break signal to stop after the counter expires.

RS485_DELAY (0x04B) - Read/Write

Bit	Default	Description
15:4	0x000	Reserved These bits are reserved and should be written as '0'.
3:0	000	Value This value is the number of bit times the XR22804 waits before de-asserting the E5/RTS#/RS485/G5 pin when it is configured for automatic RS-485 half-duplex control.

GPIO_MODE (0x04C) - Read/Write

Bit	Default	Description
15:4	0x000	Reserved These bits are reserved and should be written as '0'.
3	0	RS485 Polarity 0: Active low auto. RS-485 half-duplex enable 1: Active high auto. RS-485 half-duplex enable
2:0	0x0	GPIO Mode 000: Mode 0 - All GPIO are used for general purpose I/O. 001: Mode 1 - E5/RTS#/RS485/G5 and E4/CTS#/G4 used for Auto RTS/CTS HW Flow Control 010: Mode 2 - E3/DTR#/G3 and E2/DSR#/G2 used for Auto DTR/DSR HW Flow Control 011: Mode 3 - E5/RTS#/RS485/G5 pin used for auto RS-485 half-duplex enable during Transmit 100: Mode 4 - E5/RTS#/RS485/G5 pin used for auto RS-485 half-duplex enable after address match. 101 to 111: Reserved values, do not use.

GPIO_DIRECTION (0x04D) - Read/Write

Note that when setting direction of a UART GPIO to output, the PIN_PULLUP_EN for that IO pin should also be disabled and when setting a UART GPIO pin to input, the PIN_PULLUP_EN for that IO pin should also be enabled.

Bit	Default	Description
15:6	0x000	Reserved These bits are reserved and should be written as '0'.
5:0	0x00	GPIO[N] Direction 0: GPIO[N] is an input 1: GPIO[N] is an output

GPIO_SET (0x04E) - Write Only

Bit	Default	Description
15:6	0x000	Reserved These bits are reserved and should be written as '0'.

Bit	Default	Description
5:0	0x00	GPIO[N] Set 0: No effect 1: Set GPIO[N] if configured as an output to a logic '1'

GPIO_CLEAR (0x04F) - Write Only

Bit	Default	Description
15:6	0x000	Reserved These bits are reserved and should be written as '0'.
5:0	0x00	GPIO[N] Clear 0: No effect 1: Clear GPIO[N] if configured as an output to a logic '0'

GPIO_STATUS (0x050) - Read Only

Bit	Default	Description
15:6	0x000	Reserved These bits are reserved and should be written as '0'.
5:0	0x00	GPIO[N] Status Reading returns the current state of GPIO[N].

GPIO_INT_MASK (0x051) - Read/Write

Bit	Default	Description
15:6	0x000	Reserved These bits are reserved and should be written as '0'.
5:0	0x00	GPIO[N] Mask Dictates whether a change in GPIO pin state causes the device to generate a USB interrupt packet. In either case, the GPIO status register will still report the pin's state when read, and if an interrupt packet is formed due to other interrupt trigger, the interrupt packet will contain the current state of the pin. 0: A change in the pin's state causes the device to generate an interrupt packet. 1: A change in the pin's state does not cause the device to generate an interrupt packet.

CUSTOMIZED_INT (0x052) - Read/Write

Bit	Default	Description
15:1	0x0000	Reserved These bits are reserved and should be written as '0'.

Bit	Default	Description
0	0	<p>Enable Enables the customized interrupt packet format to report all GPIO status in the interrupt packet.</p> <p>0: Use standard interrupt packet. See Table 6 and Table 7. 1: Use customized interrupt packet. See Table 8.</p>

Table 6: Interrupt Packet Format

Offset	Field	Size (Bytes)	Value	Description
0	bmRequestType	1	8'b10100001	D7 = Device-to-host direction D6:5 = Class Type D4-0: = Interface Recipient
1	bNotification	1	8'h20	Defined encoding for SERIAL_STATE
2	wValue	2	16'h0000	
4	wIndex	2	16'h0000	D15-8 = Reserved (0) D7-0 = Interface number, 8'h00 for the CDC Command Interface
6	wLength	2	16'h0002	2 bytes of transferred data
8	Data	2	Standard int_status (See Table 7) For customized int_status Size = 4 bytes (See Table 8)	D15-7 = Reserved (0) D6 = bOverRun D5 = bParity D4 = bFraming D3 = bRingSignal (RI) D2 = bBreak D1 = bTxCarrier (DSR) D0 = bRxCarrier (CD)

Table 7: Data Field of Standard Interrupt Packet

Bits	Field	Description
D15..D7		Reserved (future use)
D6	bOverRun	Received data has been discarded due to overrun in the device.
D5	bParity	A parity error has occurred.
D4	bFraming	A framing error has occurred.
D3	bRingSignal	State of ring signal detection of the device.
D2	bBreak	State of break detection mechanism of the device.
D1	bTxCarrier	State of transmission carrier. This signal corresponds to V.24 signal 106 and RS-232 signal DSR.
D0	bRxCarrier	State of receiver carrier detection mechanism of device. This signal corresponds to V.24 signal 109 and RS-232 signal DCD.

Table 8: Data Field of Customized Interrupt Packet - Exar Vendor Specific

Bit(s)	Description
31-20	Reserved (0)
19	Overrun
18	Parity Error
17	Frame Error
16	Break Status
15-14	Reserved (0)
13	RTS state
12	CTS state
11	DTR state
10	DSR state
9	CD state
8	RI state
7-6	Reserved (0)
5	RTS change
4	CTS change
3	DTR change
2	DSR change
1	CD change
0	RI change

Overrun, Parity Error, Frame Error, and Break all indicate that at least one event has occurred since the last interrupt message. "State" reflects the high/low state of the pin at the time the Interrupt Data IN packet was generated. "Change" indicates whether the level on the pin changed at least once since the last interrupt message.

PIN_PULLUP_EN (0x054) - Read/Write

Bit	Default	Description
15:8	0	Reserved These bits are reserved and should be written as '0'.
7	1	UART TX 0: Disable internal pull-up resistor on the UART TX pin 1: Enable internal pull-up resistor on the UART TX pin
6	1	UART RX 0: Disable internal pull-up resistor on the UART RX pin 1: Enable internal pull-up resistor on the UART RX pin
5:0	0x3F	GPIO[N] 0: Disable internal pull-up resistor on the corresponding GPIO[N] pin 1: Enable internal pull-up resistor on the corresponding GPIO[N] pin

PIN_PULLDOWN_EN (0x055) - Read/Write

Bit	Default	Description
15:10	0	Reserved These bits are reserved and should be written as '0'.
7	0	UART TX 0: Disable internal pull-down resistor on the UART TX pin 1: Enable internal pull-down resistor on the UART TX pin
6	0	UART RX 0: Disable internal pull-down resistor on the UART RX pin 1: Enable internal pull-down resistor on the UART RX pin
5:0	0	GPIO[N] 0: Disable internal pull-down resistor on the corresponding GPIO[N] pin 1: Enable internal pull-down resistor on the corresponding GPIO[N] pin

LOOPBACK (0x056) - Read/Write

Bit	Default	Description
15:3	0	Reserved These bits are reserved and should be written as '0'.
2	0	DTR_DSR 0: Disable DTR to DSR internal loopback 1: Enable DTR to DSR internal loopback
1	0	RTS_CTS 0: Disable RTS to CTS internal loopback 1: Enable RTS to CTS internal loopback
0	0	TX_RX When this bit is set all transmitted UART data is looped back to the UART receiver. Note that when the internal loopback is enabled, the Tx data will be disabled and Rx data will be ignored. 0: Disable TX to RX internal loopback 1: Enable TX to RX internal loopback

IR_MODE (0x057) - Read/Write

Bit	Default	Description
15:3	0	Reserved These bits are reserved and should be written as '0'.
2	0	TX_Pulse 0: TX pulse width is 3/16 of the bit period 1: TX pulse width is 4/16 of the bit period
1	0	RX_Invert 0: RX input is not inverted before sampling 1: RX input is inverted before sampling

Bit	Default	Description
0	0	En 0: Disable IR mode 1: Enable IR mode

REMOTE_WAKEUP (0x05F) - Read/Write

Bit	Default	Description
15:4	0x000	Reserved These bits are reserved and should be written as '0'.
3	0	RX_En 0: RX pin remote wakeup is disabled 1: A high to low transition on the RX pin will cause a resume request to be sent to the USB host
2	1	RI_En 0: RI# pin remote wakeup is disabled 1: A high to low transition on the RI# pin will cause a resume request to be sent to the USB host
1:0	0x0	Reserved These bits are reserved and should be written as '0'.

TX_FIFO_RESET (0x060) - Write Only

Bit	Default	Description
15:1	0x0000	Reserved These bits are reserved and should be written as '0'.
0	000	Reset 0: No effect 1: Resets the TX FIFO to empty

TX_FIFO_FILL (0x061) - Read Only

Bit	Default	Description
15:11	0x00	Reserved These bits are reserved and should be written as '0'.
10:0	0x000	Fill Number of bytes in the TX FIFO

TX_WIDE_MODE (0x062) - Read/Write

Bit	Default	Description
15:1	0x0000	Reserved These bits are reserved and should be written as '0'.
0	0	EN In wide mode, 2 bytes of data are used to transfer one character. This requires 2 bytes of FIFO space, therefore the FIFO can hold half as many characters in wide mode. In the TX direction bit 0 of the second byte will be used as bit 9 of the character, if 9-bit mode is enabled. Bits 7:1 of the second byte are not used. 0: Disable TX wide mode 1: Enable TX wide mode

RX_FIFO_RESET (0x063) - Write Only

Bit	Default	Description
15:1	0x0000	Reserved These bits are reserved and should be written as '0'.
0	000	Reset 0: No effect 1: Resets the RX FIFO to empty

RX_FIFO_FILL (0x064) - Read Only

Bit	Default	Description
15:11	0x00	Reserved These bits are reserved and should be written as '0'.
10:0	0x000	Fill Number of bytes in the RX FIFO

RX_WIDE_MODE (0x065) - Read/Write

Bit	Default	Description
15:1	0x0000	Reserved These bits are reserved and should be written as '0'.
0	0	EN In wide mode, 2 bytes of Bulk data are used to transfer one character. This requires 2 bytes of FIFO space, therefore the FIFO can hold half as many characters in wide mode. In the RX direction, bits 3:0 of the second byte contain the error flags associated with the character. Bits 7:4 of the second byte are not used. 0: Disable RX wide mode 1: Enable RX wide mode

RX_CONTROL (0x066) - Read/Write

Bit	Default	Description
15:2	0	Reserved These bits are reserved and should be written as '0'.
1	0	Max_Pkt_Size 0: Maximum bulk-in packet size is 512 / 64 bytes in hi-speed / full-speed mode respectively (normal operation) 1: Maximum bulk-in packet size is 508 / 60 bytes in hi-speed / full-speed mode respectively (workaround for known Windows OS CDC-ACM driver issue)
0	0	Low_Latency 0: Disable low latency mode 1: Enable low latency mode

FLOW_THRESHOLD (0x067) - Read/Write

Bit	Default	Description
15:11	0x0	Reserved These bits are reserved and should be written as '0'.
10:0	0x2E0	Thresh If enabled, flow control (either hardware or software), will be asserted when the RX FIFO fill level exceeds the threshold value.

CUSTOM_DRIVER (0x081) - Read/Write

Bit	Default	Description
15:1	0x0000	Reserved These bits are reserved and should be written as '0'.
0	0	Active A custom driver should immediately enable this bit prior to using any CDC-ACM commands from the USB host, to ensure that the XR22804 does not enter CDC mode and default to the values listed in Table 3.

HID Reports

The I²C and EDGE functions in the XR22804 are both HID functions. Register access for these HID functions is performed via HID feature reports. These reports use indirect addressing such that for register reads, the address must first be written and then data can be read. Registers accessible via the HID reports along with the register descriptions are given in the following sections.

WRITE_HID_REGISTER

Transfer Type: Control Out

Transfer Size: 5 bytes

The WRITE_HID_REGISTER report writes 2 bytes of data to the specified register address.

Field	Offset	Size	Value	Description
Report ID	0	1	0x3C	Write HID register
Write Address LSB	1	1		Write address
Write Address MSB	2	1		
Write Data LSB	3	1		Write data
Write Data MSB	4	1		

SET_HID_READ_ADDRESS

Transfer Type: Control Out

Transfer Size: 3 bytes

The SET_HID_READ_ADDRESS report sets the address for the READ_HID_REGISTER report.

Field	Offset	Size	Value	Description
Report ID	0	1	0x4B	Set address for HID register read
Read Address LSB	1	1		Read address
Read Address MSB	2	1		

READ_HID_REGISTER

Transfer Type: Control In

Transfer Size: 3 bytes

The READ_HID_REGISTER report reads register data from the address set by the SET_HID_READ_ADDRESS report.

Field	Offset	Size	Value	Description
Report ID	0	1	0x5A	Read HID register
Read Data LSB	1	1		Read data
Read Data MSB	2	1		

HID Register Map

Table 9: XR22804 HID Register Map

Address	Register Name	Bit 7 (15)	Bit 6 (14)	Bit 5 (13)	Bit 4 (12)	Bit 3 (11)	Bit 2 (10)	Bit 1 (9)	Bit 0 (8)
I ² C Registers

	EDGE_PWM1_LOW LSB [BITS 7:0]	VALUE [7:0]							

HID Register Descriptions

Note that all register reset default values are '0' unless otherwise specified. All registers are 16 bits.

I²C_SCL_LOW (0x341) - Read/Write

Bit	Default	Description
15:0	0x0144	<p>Value</p> <p>Specifies the number of periods that SCL will be asserted low by the XR22804 I²C master. Note that in clock stretching, the I²C slave may extend the SCL low period to delay the next transaction. For 100 kbps transfer rate this value must be at least 252 (0x00FC) and the sum of high and low periods must be at least 600 (0x0258). For 400kbps transfer rate this value must be at least 78 (0x004E) and the sum of the high and low periods must be at least 150 (0x0096). Measured in 60 MHz core clock periods, i.e. approximately 16.7 ns.</p>

I²C_SCL_HIGH (0x342) - Read/Write

Bit	Default	Description
15:0	0x0114	<p>Value</p> <p>Specifies the number of periods that SCL will be asserted high by the XR22804 I²C master. Note that another multi-master may assert SCL low before the XR22804 high period is completed. For 100 kbps transfer rate this value must be at least 240 (0x00F0) and the sum of the high and low periods must be at least 600 (0x0258). For 400 kbps transfer rate this value must be at least 36 (0x0024) and the sum of the high and low periods must be at least 150 (0x0096). Measured in 60 MHz core clock periods, i.e. approximately 16.7 ns</p>

EDGE_FUNC_SEL_0 (0x3C0) - Read/Write

Bit	Default	Description
15:0	0x0000	<p>E[15:0]</p> <p>0: IO is assigned to the UART / GPIO function. IO pin controlled using UART registers. 1: IO is assigned to the EDGE function. IO pin controlled using EDGE registers.</p>

EDGE_DIR_0 (0x3C1) - Read/Write

Note that when setting direction of an EDGE IO to output, the EDGE_PULL_UP for that IO pin should also be disabled and when setting an EDGE IO pin to input, the EDGE_PULL_UP for that IO pin should also be enabled.

Bit	Default	Description
15:0	0x0000	<p>E[15:0]</p> <p>0: IO pin assigned to EDGE function is configured as an input 1: IO pin assigned to EDGE function is configured as an output.</p>

EDGE_SET_0 (0x3C2) - Write Only

Bit	Default	Description
15:0	0x0000	E[15:0] 0: No effect 1: Set IO pin assigned to EDGE function and configured as an output to a logic '1'

EDGE_CLEAR_0 (0x3C3) - Write Only

Bit	Default	Description
15:0	0x0000	E[15:0] 0: No effect 1: Clear IO pin assigned to EDGE function and configured as an output to a logic '0'

EDGE_STATE_0 (0x3C4) - Read/Write

Bit	Default	Description
15:0	0x0000	E[15:0] Writing in this register sets or clears the EDGE IO pin(s) configured as an output. Writing to an EDGE pin configured as an input has no effect. Reading this register returns the state of each IO pin configured as an EDGE pin irrespective of whether it is configured as an input or output. Note that output transitions across multiple IO pins may be slightly staggered. Refer to EDGE section on page 17. 0: Write clears the corresponding bit to a '0'. Read returns the current state. 1: Write sets the corresponding bit to a '1'. Read returns the current state.

EDGE_TRI_STATE_0 (0x3C5) - Read/Write

Bit	Default	Description
15:0	0x0000	E[15:0] 0: IO pin assigned to EDGE function and configured as an output is actively driven 1: IO pin assigned to EDGE function and configured as an output is tri-stated

EDGE_OPEN_DRAIN_0 (0x3C6) - Read/Write

Bit	Default	Description
15:0	0x0000	E[15:0] Note that XR22804 open drain outputs have a weak internal pull-up. 0: IO pin assigned to EDGE function and configured as an output is a push-pull output 1: IO pin assigned to EDGE function and configured as an output is an open drain output

EDGE_PULL_UP_0 (0x3C7) - Read/Write

Bit	Default	Description
15:0	0xFFFF	E[15:0] 0: Disable internal pull-up resistor on IO pin assigned to EDGE function and configured as an input 1: Enable internal pull-up resistor on IO pin assigned to EDGE function and configured as an input

EDGE_PULL_DOWN_0 (0x3C8) - Read/Write

Bit	Default	Description
15:0	0x0000	E[15:0] 0: Disable internal pull-down resistor on IO pin assigned to EDGE function and configured as an input 1: Enable internal pull-down resistor on IO pin assigned to EDGE function and configured as an input

EDGE_INTR_MASK_0 (0x3C9) - Read/Write

Bit	Default	Description
15:0	0x0000	E[15:0] Writing a '1' in this register enables an input pin for the corresponding bit position EDGE IO pin(s) configured as an input to generate an interrupt if either EDGE_INTR_POS_EDGE and / or EDGE_INTR_NEG_EDGE registers has also been enabled. An EDGE pin configured as an output has no effect. 0: IO pin will not generate an interrupt 1: IO pin assigned to EDGE function and configured as an input will generate an interrupt

EDGE_INTR_POS_EDGE_0 (0x3CA) - Read/Write

Bit	Default	Description
15:0	0xFFFF	E[15:0] Writing a '1' in this register enables an interrupt to be generated on the rising edge of the corresponding bit position EDGE IO pin(s) configured as an input if the EDGE_INTR_MASK register is enabled for that pin. If the EDGE_INTR_NEG_EDGE register is also enabled, interrupts will be generated on both edges. Writing to an EDGE pin configured as an output has no effect. 0: IO pin will not generate an interrupt on rising edge 1: IO pin assigned to EDGE function and configured as an input will generate an interrupt on rising edge if corresponding EDGE_INTR_MASK bit is set

EDGE_INTR_NEG_EDGE_0 (0x3CB) - Read/Write

Bit	Default	Description
15:0	0xFFFF	<p>E[15:0] Writing a '1' in this register enables an interrupt to be generated on the falling edge of the corresponding bit position EDGE IO pin(s) configured as an input if the EDGE_INTR_MASK register is enabled for that pin. If the EDGE_INTR_POS_EDGE register is also enabled, interrupts will be generated on both edges. Writing to an EDGE pin configured as an output has no effect.</p> <p>0: IO pin will not generate an interrupt on falling edge 1: IO pin assigned to EDGE function and configured as an input will generate an interrupt on falling edge if corresponding EDGE_INTR_MASK bit is set</p>

EDGE_FUNC_SEL_1 (0x3CC) - Read/Write

Bit	Default	Description
31:16	0x0000	<p>E[31:16] 0: IO is assigned to the UART / GPIO function. IO pin controlled using UART registers. 1: IO is assigned to the EDGE function. IO pin controlled using EDGE registers.</p>

EDGE_DIR_1 (0x3CD) - Read/Write

Note that when setting direction of an EDGE IO to output, the EDGE_PULL_UP for that IO pin should also be disabled and when setting an EDGE IO pin to input, the EDGE_PULL_UP for that IO pin should also be enabled.

Bit	Default	Description
31:16	0x0000	<p>E[31:16] 0: IO pin assigned to EDGE function is configured as an input 1: IO pin assigned to EDGE function is configured as an output.</p>

EDGE_SET_1 (0x3CE) - Write Only

Bit	Default	Description
31:16	0x0000	<p>E[31:16] 0: No effect 1: Set IO pin assigned to EDGE function and configured as an output to a logic '1'</p>

EDGE_CLEAR_1 (0x3CF) - Write Only

Bit	Default	Description
31:16	0x0000	E[31:16] 0: No effect 1: Clear IO pin assigned to EDGE function and configured as an output to a logic '0'

EDGE_STATE_1 (0x3D0) - Read/Write

Bit	Default	Description
31:16	0x0000	E[31:16] Writing in this register sets or clears the EDGE IO pin(s) configured as an output. Writing to an EDGE pin configured as an input has no effect. Reading this register returns the state of each IO pin configured as an EDGE pin irrespective of whether it is configured as an input or output. Note that output transitions across multiple IO pins may be slightly staggered. Refer to EDGE section on page 17. 0: Write clears the corresponding bit to a '0'. Read returns the current state. 1: Write sets the corresponding bit to a '1'. Read returns the current state.

EDGE_TRI_STATE_1 (0x3D1) - Read/Write

Bit	Default	Description
31:16	0x0000	E[31:16] 0: IO pin assigned to EDGE function and configured as an output is actively driven 1: IO pin assigned to EDGE function and configured as an output is tri-stated

EDGE_OPEN_DRAIN_1 (0x3D2) - Read/Write

Bit	Default	Description
31:16	0x0000	E[31:16] Note that XR22804 open drain outputs have a weak internal pull-up. 0: IO pin assigned to EDGE function and configured as an output is a push-pull output 1: IO pin assigned to EDGE function and configured as an output is an open drain output

EDGE_PULL_UP_1 (0x3D3) - Read/Write

Bit	Default	Description
31:16	0xFFFF	E[31:16] 0: Disable internal pull-up resistor on IO pin assigned to EDGE function and configured as an input 1: Enable internal pull-up resistor on IO pin assigned to EDGE function and configured as an input

EDGE_PULL_DOWN_1 (0x3D4) - Read/Write

Bit	Default	Description
31:16	0x0000	E[31:16] 0: Disable internal pull-down resistor on IO pin assigned to EDGE function and configured as an input 1: Enable internal pull-down resistor on IO pin assigned to EDGE function and configured as an input

EDGE_INTR_MASK_1 (0x3D5) - Read/Write

Bit	Default	Description
31:16	0x0000	E[31:16] Writing a '1' in this register enables an input pin for the corresponding bit position EDGE IO pin(s) configured as an input to generate an interrupt if either EDGE_INTR_POS_EDGE and / or EDGE_INTR_NEG_EDGE registers has also been enabled. An EDGE pin configured as an output has no effect. 0: IO pin will not generate an interrupt 1: IO pin assigned to EDGE function and configured as an input will generate an interrupt

EDGE_INTR_POS_EDGE_1 (0x3D6) - Read/Write

Bit	Default	Description
31:16	0xFFFF	E[31:16] Writing a '1' in this register enables an interrupt to be generated on the rising edge of the corresponding bit position EDGE IO pin(s) configured as an input if the EDGE_INTR_MASK register is enabled for that pin. If the EDGE_INTR_NEG_EDGE register is also enabled, interrupts will be generated on both edges. Writing to an EDGE pin configured as an output has no effect. 0: IO pin will not generate an interrupt on rising edge 1: IO pin assigned to EDGE function and configured as an input will generate an interrupt on rising edge if corresponding EDGE_INTR_MASK bit is set

EDGE_INTR_NEG_EDGE_1 (0x3D7) - Read/Write

Bit	Default	Description
31:16	0xFFFF	E[31:16] Writing a '1' in this register enables an interrupt to be generated on the falling edge of the corresponding bit position EDGE IO pin(s) configured as an input if the EDGE_INTR_MASK register is enabled for that pin. If the EDGE_INTR_POS_EDGE register is also enabled, interrupts will be generated on both edges. Writing to an EDGE pin configured as an output has no effect. 0: IO pin will not generate an interrupt on falling edge 1: IO pin assigned to EDGE function and configured as an input will generate an interrupt on falling edge if corresponding EDGE_INTR_MASK bit is set

EDGE_PWM0_CTRL (0x3D8) - Read/Write

Bit	Default	Description
15:9	0x00	Reserved These bits are reserved and should be written as '0'.
8:6	0x0	Cmd 000: Idle. output pin remains at same state 001: Undefined, do not use 010: Undefined, do not use 011: Undefined, do not use 100: Assert logic '0' 101: One-shot -If previous state was assert '0', one-shot pulse will be high, If previous state was assert '1', one-shot pulse will be low 110: Free run output 111: Assert logic '0'
5	0	Enable 0: PWM0 output is not enabled 1: PWM0 output is enabled on pin specified in Pin field using mode specified in Cmd field
4:0	0x00	Pin Specifies which pin (E31 - E0) will be assigned to PWM0 output.

EDGE_PWM0_HIGH (0x3D9) - Read/Write

Bit	Default	Description
15:12	0x0	Reserved These bits are reserved and should be written as '0'.
11:0	0x001	Value This register specifies the high period for PWM0 in increments of 266.667ns. High period must be in the range of 1 to 4095 (266.667 ns to 1.092 ms)

EDGE_PWM0_LOW (0x3DA) - Read/Write

Bit	Default	Description
15:12	0x0	Reserved These bits are reserved and should be written as '0'.
11:0	0x001	Value This register specifies the low period for PWM0 in increments of 266.667ns. Low period must be in the range of 1 to 4095 (266.667 ns to 1.092 ms)

EDGE_PWM1_CTRL (0x3DB) - Read/Write

Bit	Default	Description
15:9	0x00	Reserved These bits are reserved and should be written as '0'.
8:6	0x0	Cmd 000: Idle. output pin remains at same state 001: Undefined, do not use 010: Undefined, do not use 011: Undefined, do not use 100: Assert logic '0' 101: One-shot -If previous state was assert '0', one-shot pulse will be high, If previous state was assert '1', one-shot pulse will be low 110: Free run output 111: Assert logic '0'
4:0	0x00	Pin Specifies which pin (E31 - E0) will be assigned to PWM1 output.

EDGE_PWM1_HIGH (0x3DC) - Read/Write

Bit	Default	Description
15:12	0x0	Reserved These bits are reserved and should be written as '0'.
11:0	0x001	Value This register specifies the high period for PWM1 in increments of 266.667ns. High period must be in the range of 1 to 4095 (266.667 ns to 1.092 ms)

EDGE_PWM1_LOW (0x3DD) - Read/Write

Bit	Default	Description
15:12	0x0	Reserved These bits are reserved and should be written as '0'.
11:0	0x001	Value This register specifies the low period for PWM1 in increments of 266.667ns. Low period must be in the range of 1 to 4095 (266.667 ns to 1.092 ms)
