### 3.3V, Low Power, High Speed or Slew Rate Limited, RS-485/RS-422 Transceivers

These Intersil RS-485/RS-422 devices are BiCMOS 3.3V powered, single transceivers that meet both the RS-485 and RS-422 standards for balanced communication. Unlike competitive devices, this Intersil family is specified for 10\% tolerance supplies ( 3 V to 3.6 V ).
The ISL83483 and ISL83488 utilize slew rate limited drivers which reduce EMI, and minimize reflections from improperly terminated transmission lines, or unterminated stubs in multidrop and multipoint applications.

Data rates up to 10 Mbps are achievable by using the ISL83485, ISL83490, or ISL83491, which feature higher slew rates.

Logic inputs (e.g., DI and DE) accept signals in excess of 5.5 V , making them compatible with 5 V logic families.

Receiver ( Rx ) inputs feature a "fail-safe if open" design, which ensures a logic high output if $R x$ inputs are floating. All devices present a "single unit load" to the RS-485 bus, which allows up to 32 transceivers on the network.

Driver (Tx) outputs are short circuit protected, even for voltages exceeding the power supply voltage. Additionally, on-chip thermal shutdown circuitry disables the Tx outputs to prevent damage if power dissipation becomes excessive.

The ISL83488, ISL83490, ISL83491 are configured for full duplex (separate Rx input and Tx output pins) applications. The ISL83488 and ISL83490 are offered in space saving 8 lead packages for applications not requiring Rx and Tx output disable functions (e.g., point-to-point and RS-422). Half duplex configurations (ISL83483, ISL83485) multiplex the Rx inputs and Tx outputs to provide transceivers with $R x$ and $T x$ disable functions in 8 lead packages.

## Features

- Operate from a Single +3.3V Supply (10\% Tolerance)
- Interoperable with 5V Logic
- High Data Rates up to 10 Mbps
- Single Unit Load Allows up to 32 Devices on the Bus
- Slew Rate Limited Versions for Error Free Data Transmission (ISL83483, ISL83488) . . . . . up to 250 kbps
- Low Current Shutdown Mode (ISL83483, ISL83485, ISL83491). .15nA
- -7 V to +12 V Common Mode Input Voltage Range
- Three State Rx and Tx Outputs (Except ISL83488, ISL83490)
- 10ns Propagation Delay, 1ns Skew (ISL83485, ISL83490, ISL83491)
- Full Duplex and Half Duplex Pinouts
- Current Limiting and Thermal Shutdown for driver Overload Protection
- Pb-free available

## Applications

- Factory Automation
- Security Networks
- Building Environmental Control Systems
- Industrial/Process Control Networks
- Level Translators (e.g., RS-232 to RS-422)
- RS-232 "Extension Cords"

TABLE 1. SUMMARY OF FEATURES

*Add "-T" suffix to part number for tape and reel packaging.
NOTE: Intersil Pb-free products employ special Pb-free material sets; molding compounds/die attach materials and 100\% matte tin plate termination finish, which is compatible with both SnPb and Pb -free soldering operations. Intersil Pb -free products are MSL classified at Pb -free peak reflow temperatures that meet or exceed the Pb -free requirements of IPC/JEDEC J Std-020B.

## Pin Descriptions

| PIN | FUNCTION |
| :---: | :---: |
| RO | Receiver output: If $\mathrm{A}>\mathrm{B}$ by at least $0.2 \mathrm{~V}, \mathrm{RO}$ is high; If $\mathrm{A}<\mathrm{B}$ by 0.2 V or more, RO is low; $\mathrm{RO}=$ High if A and B are unconnected (floating). |
| $\overline{\mathrm{RE}}$ | Receiver output enable. RO is enabled when $\overline{\mathrm{RE}}$ is low; RO is high impedance when $\overline{R E}$ is high. |
| DE | Driver output enable. The driver outputs, Y and Z , are enabled by bringing DE high. They are high impedance when DE is low. |
| DI | Driver input. A low on DI forces output Y low and output Z high. Similarly, a high on DI forces output Y high and output Z low. |
| GND | Ground connection. |
| A/Y | Noninverting receiver input and noninverting driver output. Pin is an input if $\mathrm{DE}=0$; pin is an output if $\mathrm{DE}=1$. |
| B/Z | Inverting receiver input and inverting driver output. Pin is an input if $\mathrm{DE}=0$; pin is an output if $\mathrm{DE}=1$. |
| A | Noninverting receiver input. |
| B | Inverting receiver input. |
| Y | Noninverting driver output. |
| Z | Inverting driver output. |
| $\mathrm{V}_{\text {cc }}$ | System power supply input (3V to 3.6V). |
| NC | No Connection. |

## Typical Operating Circuits

ISL83488, ISL83490

ISL83491

## Absolute Maximum Ratings

| $\mathrm{V}_{\mathrm{CC}}$ to Ground.............................................. 7V Input Voltages |  |
| :---: | :---: |
|  |  |
| DI, DE, RE | -0.5 V to +7 V |
| Input/Output Voltages |  |
| A, B, Y, Z | -8 V to +12.5 V |
| RO | -0.5 V to ( $\left.\mathrm{V}_{\mathrm{CC}}+0.5 \mathrm{~V}\right)$ |
| Short Circuit Duration |  |
| Y, Z | Continuous |

## Thermal Information

| Thermal Resistance (Typical, Note 1) | $\theta_{\mathrm{JA}}\left({ }^{\circ} \mathrm{C} / \mathrm{W}\right)$ |
| :---: | :---: |
| 8 Ld SOIC Package | 170 |
| 8 Ld PDIP Package | 140 |
| 14 Ld SOIC Package | 130 |
| 14 Ld PDIP Package | 105 |
| Maximum Junction Temperature (Plastic Package) | $150^{\circ} \mathrm{C}$ |
| Maximum Storage Temperature Range | $-65^{\circ} \mathrm{C}$ to $150^{\circ} \mathrm{C}$ |
| Maximum Lead Temperature (Soldering 10s) ... (SOIC- Lead Tips Only) | $300^{\circ} \mathrm{C}$ |

## Operating Conditions

Temperature Range
$\qquad$

CAUTION: Stresses above those listed in "Absolute Maximum Ratings" may cause permanent damage to the device. This is a stress only rating and operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied.

NOTE:

1. $\theta_{\mathrm{JA}}$ is measured with the component mounted on a low effective thermal conductivity test board in free air. See Tech Brief TB379 for details.

Electrical Specifications Test Conditions: $\mathrm{V}_{\mathrm{CC}}=3 \mathrm{~V}$ to 3.6 V ; Unless Otherwise Specified. Typicals are at $\mathrm{V}_{\mathrm{CC}}=3.3 \mathrm{~V}, \mathrm{~T}_{\mathrm{A}}=25^{\circ} \mathrm{C}$, Note 2

NOTES:
2. All currents into device pins are positive; all currents out of device pins are negative. All voltages are referenced to device ground unless otherwise specified.
3. Supply current specification is valid for loaded drivers when $D E=0 \mathrm{~V}$.
4. Applies to peak current. See "Typical Performance Curves" for more information.
5. When testing the ISL83483, ISL83485, ISL83491, keep $\overline{R E}=0$ to prevent the device from entering SHDN.
6. When testing the ISL83483, ISL83485, ISL83491, the $\overline{R E}$ signal high time must be short enough (typically $<100$ ns) to prevent the device from entering SHDN.
7. The ISL83483, ISL83485, ISL83491 are put into shutdown by bringing $\overline{R E}$ high and DE low. If the inputs are in this state for less than 80 ns, the parts are guaranteed not to enter shutdown. If the inputs are in this state for at least 300ns, the parts are guaranteed to have entered shutdown. See "Low-Power Shutdown Mode" section.
8. Keep $\overline{R E}=V C C$, and set the DE signal low time $>300$ ns to ensure that the device enters SHDN.
9. Set the $\overline{R E}$ signal high time $>300$ ns to ensure that the device enters SHDN.

## Application Information

RS-485 and RS-422 are differential (balanced) data transmission standards for use in long haul or noisy environments. RS-422 is a subset of RS-485, so RS-485 transceivers are also RS-422 compliant. RS-422 is a point-to-multipoint (multidrop) standard, which allows only one driver and up to 10 (assuming one unit load devices) receivers on each bus. RS-485 is a true multipoint standard, which allows up to 32 one unit load devices (any combination of drivers and receivers) on each bus. To allow for multipoint operation, the RS-485 spec requires that drivers must handle bus contention without sustaining any damage.

Another important advantage of RS-485 is the extended common mode range (CMR), which specifies that the driver outputs and receiver inputs withstand signals that range from +12 V to -7 V . RS-422 and RS-485 are intended for runs as long as 4000', so the wide CMR is necessary to handle ground potential differences, as well as voltages induced in the cable by external fields.

## Receiver Features

These devices utilize a differential input receiver for maximum noise immunity and common mode rejection. Input sensitivity is $\pm 200 \mathrm{mV}$, as required by the RS422 and RS-485 specifications.

Receiver input impedance surpasses the RS-422 spec of $4 \mathrm{k} \Omega$, and meets the RS-485 "Unit Load" requirement of $12 \mathrm{k} \Omega$ minimum.

Receiver inputs function with common mode voltages as great as $+9 \mathrm{~V} /-7 \mathrm{~V}$ outside the power supplies (i.e., +12 V and -7 V ), making them ideal for long networks where induced voltages are a realistic concern.

All the receivers include a "fail-safe if open" function that guarantees a high level receiver output if the receiver inputs are unconnected (floating).

Receivers easily meet the data rates supported by the corresponding driver.

ISL83483, ISL83485, ISL83491 receiver outputs are tristatable via the active low $\overline{R E}$ input.

## Driver Features

The RS-485, RS-422 driver is a differential output device that delivers at least 1.5 V across a $54 \Omega$ load (RS-485), and at least 2 V across a $100 \Omega$ load (RS-422) even with $\mathrm{V}_{\mathrm{CC}}=3 \mathrm{~V}$. The drivers feature low propagation delay skew to maximize bit width, and to minimize EMI.

Drivers of the ISL83483, ISL83485, ISL83491 are tri-statable via the active high DE input.

ISL83483/88 driver outputs are slew rate limited to minimize EMI, and to minimize reflections in unterminated or improperly terminated networks. Data rate on these slew
rate limited versions is a maximum of 250 kbps . Outputs of ISL83485, ISL83490, ISL83491 drivers are not limited, so faster output transition times allow data rates of at least 10Mbps.

## Data Rate, Cables, and Terminations

RS-485, RS-422 are intended for network lengths up to 4000', but the maximum system data rate decreases as the transmission length increases. Devices operating at 10Mbps are limited to lengths of a few hundred feet, while the 250kbps versions can operate at full data rates with lengths in excess of 1000'.

Twisted pair is the cable of choice for RS-485, RS-422 networks. Twisted pair cables tend to pick up noise and other electromagnetically induced voltages as common mode signals, which are effectively rejected by the differential receivers in these ICs.

Proper termination is imperative, when using the 10 Mbps devices, to minimize reflections. Short networks using the 250 kbps versions need not be terminated, but, terminations are recommended unless power dissipation is an overriding concern.

In point-to-point, or point-to-multipoint (single driver on bus) networks, the main cable should be terminated in its characteristic impedance (typically 120 2 ) at the end farthest from the driver. In multi-receiver applications, stubs connecting receivers to the main cable should be kept as short as possible. Multipoint (multi-driver) systems require that the main cable be terminated in its characteristic impedance at both ends. Stubs connecting a transceiver to the main cable should be kept as short as possible.

## Built-In Driver Overload Protection

As stated previously, the RS-485 spec requires that drivers survive worst case bus contentions undamaged. The ISL834XX devices meet this requirement via driver output short circuit current limits, and on-chip thermal shutdown circuitry.

The driver output stages incorporate short circuit current limiting circuitry which ensures that the output current never exceeds the RS-485 spec, even at the common mode voltage range extremes. Additionally, these devices utilize a foldback circuit which reduces the short circuit current, and thus the power dissipation, whenever the contending voltage exceeds either supply.

In the event of a major short circuit condition, ISL834XX devices also include a thermal shutdown feature that disables the drivers whenever the die temperature becomes excessive. This eliminates the power dissipation, allowing the die to cool. The drivers automatically reenable after the die temperature drops about 15 degrees. If the contention persists, the thermal shutdown/reenable cycle repeats until the fault is cleared. Receivers stay operational during thermal shutdown.

## Low Power Shutdown Mode (ISL83483, ISL83485, ISL83491 Only)

These CMOS transceivers all use a fraction of the power required by their bipolar counterparts, but the ISL83483, ISL83485, ISL83491 include a shutdown feature that reduces the already low quiescent $\mathrm{I}_{\mathrm{CC}}$ to a 15 nA trickle. They enter shutdown whenever the receiver and driver are simultaneously disabled ( $\overline{\mathrm{RE}}=\mathrm{V}_{\mathrm{CC}}$ and $\mathrm{DE}=\mathrm{GND}$ ) for a
period of at least 300 ns . Disabling both the driver and the receiver for less than 80 ns guarantees that shutdown is not entered.

Note that receiver and driver enable times increase when these devices enable from shutdown. Refer to Notes 5-9, at the end of the Electrical Specification table, for more information.
