

Free Positioning, Qi Compliant Wireless Power Transmitter Manager

 Check for Samples: [bq500410A](#)

FEATURES

- Expanded Free Positioning Using Three Coil Transmit Array
- Intelligent Control of Wireless Power Transfer
- Conforms to Wireless Power Consortium (WPC) A6 Transmitter Specification
- Digital Demodulation Reduces Components
- WPC1.1 Ready, Including Foreign Object Detection (FOD)
- Enhanced Parasitic Metal Detection (PMOD) Assures Safety
- Over-Current Protection
- LED Indication of Charging State and Fault Status

APPLICATIONS

- WPC 1.1 Ready Wireless Chargers for:
 - Smart Phones and other Handhelds
 - Hermetically Sealed Devices and Tools
 - Cars and Other Vehicles
 - Tabletop Charge Surfaces
- See www.ti.com/wirelesspower for More Information on TI's Wireless Charging Solutions

DESCRIPTION

The bq500410A is a free-positioning digital wireless power controller that integrates all functions required to control wireless power transfer to a WPC compliant receiver. It is WPC 1.1 ready and designed for 12-V systems but applicable to other supply voltages. The bq500410A *pings* the surrounding environment for WPC compliant devices to be powered, safely engages the device, reads the packet feedback from the powered device, and manages the power transfer. A charging area of at least 70 mm x 20 mm provides flexible receiver placement on a transmitter pad. The bq500410A supports both Parasitic Metal Detection (PMOD) and Foreign Object Detection (FOD) by continuously monitoring the efficiency of the established power transfer, protecting from power lost due to metal objects misplaced in the wireless power transfer path. Should any abnormal condition develop during power transfer, the bq500410A handles it and provides fault indicator outputs. Comprehensive protection features provide a robust design to protect the system in all receiver placements.

The bq500410A is available in an area saving 48-pin, 7 mm x 7 mm QFN package and operates over a temperature range from -40°C to 110°C .

Functional Diagram and Efficiency Versus System Output Current

Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet.

These devices have limited built-in ESD protection. The leads should be shorted together or the device placed in conductive foam during storage or handling to prevent electrostatic damage to the MOS gates.

ORDERING INFORMATION⁽¹⁾

OPERATING TEMPERATURE RANGE, T _A	ORDERABLE PART NUMBER	PIN COUNT	SUPPLY	PACKAGE	TOP-SIDE MARKING
-40°C to 110°C	bq500410ARGZR	48 pin	Reel of 2500	QFN	bq500410A
	bq500410ARGZT	48 pin	Reel of 250	QFN	bq500410A

(1) For the most current package and ordering information, see the Package Option Addendum at the end of this document, or see the TI web site at www.ti.com.

ABSOLUTE MAXIMUM RATINGS⁽¹⁾

over operating free-air temperature range (unless otherwise noted)

	VALUE		UNIT
	MIN	MAX	
Voltage applied at V33D to DGND	-0.3	3.6	V
Voltage applied at V33A to AGND	-0.3	3.6	
Voltage applied to any pin ⁽²⁾	-0.3	3.6	
Storage temperature, T _{STG}	-40	150	°C

(1) Stresses beyond those listed under *absolute maximum ratings* may cause permanent damage to the device. These are stress ratings only and functional operation of the device at these or any other conditions beyond those indicated under *recommended operating conditions* is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

(2) All voltages referenced to GND.

RECOMMENDED OPERATING CONDITIONS

over operating free-air temperature range (unless otherwise noted)

		MIN	NOM	MAX	UNIT
V	Supply voltage during operation, V33D, V33A	3.0	3.3	3.6	V
T _A	Operating free-air temperature range	-40		110	°C
T _J	Junction temperature			110	

THERMAL INFORMATION

THERMAL METRIC ⁽¹⁾		bq500410A		UNITS
		RGZ		
		48 PINS		
θ _{JA}	Junction-to-ambient thermal resistance ⁽²⁾	27.1		°C/W
θ _{JCtop}	Junction-to-case (top) thermal resistance ⁽³⁾	12.9		
θ _{JB}	Junction-to-board thermal resistance ⁽⁴⁾	4.3		
ψ _{JT}	Junction-to-top characterization parameter ⁽⁵⁾	0.2		
ψ _{JB}	Junction-to-board characterization parameter ⁽⁶⁾	4.3		
θ _{JCbot}	Junction-to-case (bottom) thermal resistance ⁽⁷⁾	0.6		

- (1) For more information about traditional and new thermal metrics, see the *IC Package Thermal Metrics* application report, [SPRA953](#).
- (2) The junction-to-ambient thermal resistance under natural convection is obtained in a simulation on a JEDEC-standard, high-K board, as specified in JESD51-7, in an environment described in JESD51-2a.
- (3) The junction-to-case (top) thermal resistance is obtained by simulating a cold plate test on the package top. No specific JEDEC-standard test exists, but a close description can be found in the ANSI SEMI standard G30-88.
- (4) The junction-to-board thermal resistance is obtained by simulating in an environment with a ring cold plate fixture to control the PCB temperature, as described in JESD51-8.
- (5) The junction-to-top characterization parameter, ψ_{JT}, estimates the junction temperature of a device in a real system and is extracted from the simulation data for obtaining θ_{JA}, using a procedure described in JESD51-2a (sections 6 and 7).
- (6) The junction-to-board characterization parameter, ψ_{JB}, estimates the junction temperature of a device in a real system and is extracted from the simulation data for obtaining θ_{JA}, using a procedure described in JESD51-2a (sections 6 and 7).
- (7) The junction-to-case (bottom) thermal resistance is obtained by simulating a cold plate test on the exposed (power) pad. No specific JEDEC standard test exists, but a close description can be found in the ANSI SEMI standard G30-88.

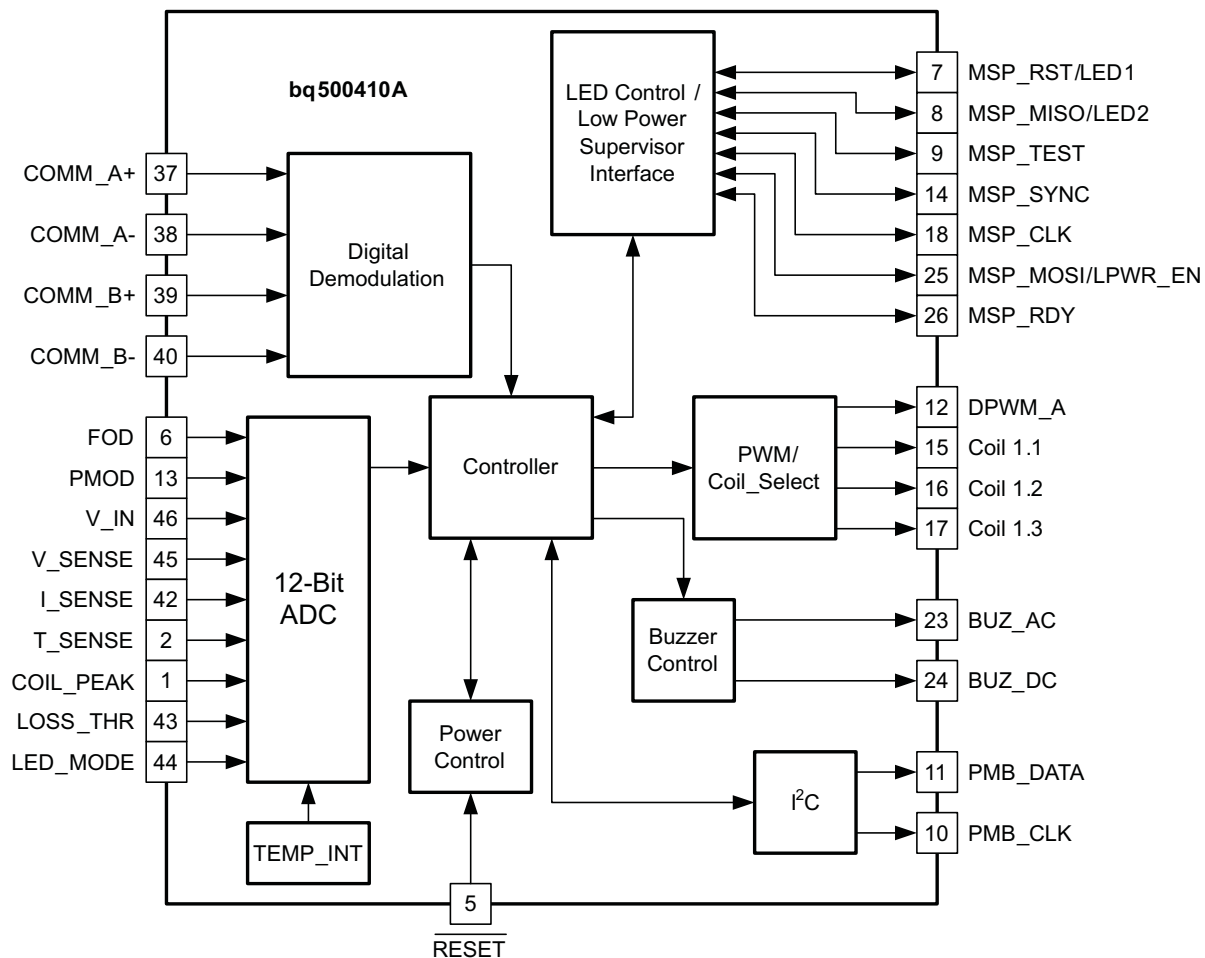

ELECTRICAL CHARACTERISTICS

over operating free-air temperature range (unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	NOM	MAX	UNIT
SUPPLY CURRENT						
I_{V33A}	Supply current	V33A = 3.3 V		8	15	mA
I_{V33D}		V33D = 3.3 V		42	55	
I_{Total}		V33D = V33A = 3.3 V		52	60	
INTERNAL REGULATOR CONTROLLER INPUTS/OUTPUTS						
V33	3.3-V linear regulator	Emitter of NPN transistor	3.25	3.3	3.6	V
V33FB	3.3-V linear regulator feedback			4	4.6	
I_{V33FB}	Series pass base drive	$V_{IN} = 12$ V; current into V33FB pin		10		mA
Beta	Series NPN pass device		40			
EXTERNALLY SUPPLIED 3.3 V POWER						
V33D	Digital 3.3-V power	$T_A = 25^\circ\text{C}$	3		3.6	V
V33A	Analog 3.3-V power	$T_A = 25^\circ\text{C}$	3		3.6	
V33Slew	3.3-V slew rate	3.3-V slew rate between 2.3 V and 2.9 V, V33A = V33D	0.25			V/ms
DIGITAL DEMODULATION INPUTS: COMM_A+, COMM_A-, COMM_B+, COMM_B-						
V_{CM}	Common mode voltage each pin		-0.15		1.631	V
COMM+, COMM-	Modulation voltage digital resolution			1		mV
R_{EA}	Input Impedance	Ground reference	0.5	1.5	3	M Ω
I_{OFFSET}	Input offset current	1-k Ω source impedance	-5		5	μA
ANALOG INPUTS: V_IN, V_SENSE, I_SENSE, T_SENSE, LED_MODE, LOSS_THR						
V_{ADC_OPEN}	Voltage indicating open pin	LED_MODE, LOSS_THR open	2.37			V
V_{ADC_SHORT}	Voltage indicating pin shorted to GND	LED_MODE, LOSS_THR shorted to ground			0.36	
V_{ADC_RANGE}	Measurement range for voltage monitoring	ALL ANALOG INPUTS	0		2.5

Functional Block Diagram

**48-Pin RGZ (QFN) Package
(Top View)**

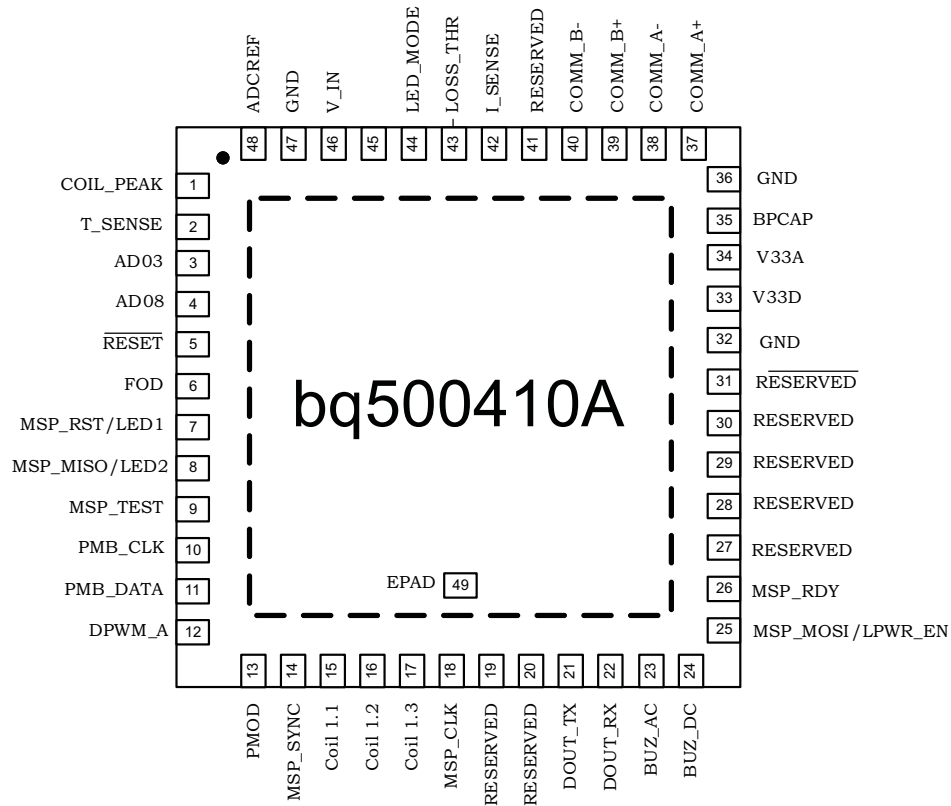

Table 1. bq500410A Pin Description

PIN		I/O	DESCRIPTION
NO.	NAME		
1	COIL_PEAK	I	Input from peak detect circuit
2	T_SENSE	I	Sensor input. Device shuts down when below 1 V. If not used, keep above 1 V by simply connecting to 3.3-V supply
3	AD03	I	This pin can be either connected to GND or left open. Connecting to GND can improve layout grounding
4	AD08	I	Reserved. Connect to 3.3-V supply
5	RESET	I	Device reset. Use 10-k Ω to 100-k Ω pull-up resistor to 3.3-V supply
6	FOD	O	FOD read pin. Leave open unless PMOD and FOD thresholds need to be different. It controls the FOD threshold resistor read at startup.
7	MSP_RST/LED1	I	A dual function pin. MSP – RST provides serial communication to the external supervisor. LED1 -- If external MSP430 is not used, connect to a (green) LED via 470- Ω resistor for status indication. Grounding pin 25 determines this pin's function.
8	MSP_MISO/LED2	I	A dual function pin. MSP – MISO provided serial communication to the external supervisor. LED2 -- If external MSP430 is not used, connect to a (red) LED via 470- Ω resistor for status indication. Grounding pin 25 determines this pin's function.
9	MSP_TEST	I	MSP – Test, If external MSP430 is not used, leave this pin open
10	PMB_CLK	I/O	10-k Ω pull-up resistor to 3.3-V supply. I ² C/PMBus is for factory use only.
11	PMB_DATA	I/O	10-k Ω pull-up resistor to 3.3-V supply. I ² C/PMBus is for factory use only.
12	DPWM_A	O	PWM Output to half bridge driver. Switching dead times must be externally generated.
13	PMOD	O	PMOD read pin. Leave open unless PMOD and FOD thresholds need to be different. It controls the PMOD threshold resistor read at startup.
14	MSP_SYNC	O	MSP SPI_SYNC, If external MSP430 is not used, leave this pin open
15	COIL 1.1	O	Enables the first coil drive train and COMM signal selector
16	COIL 1.2	O	Enables the second coil drive train and COMM signal selector
17	COIL 1.3	O	Enables the third coil drive train and COMM signal selector
18	MSP_CLK	I/O	MSP430 JTAG_CLK, SPI_CLK. Used for boot loading the MSP430 supervisor
19	RESERVED	O	Reserved, leave this pin open.
20	RESERVED	I	Reserved, connect to GND.
21	DOUT_TX	I	Reserved, leave this pin open
22	DOUT_RX	I	Reserved, leave this pin open
23	BUZ_AC	O	AC buzzer output. A 400-ms, 4-kHz AC pulse train when charging begins
24	BUZ_DC	O	DC buzzer output. A 400-ms DC pulse when charging begins. This could also be connected to an LED via 470- Ω resistor.
25	MSP_MOSI/LPWR_EN	I/O	MSP-TDI, SPI-MOSI, Low Standby Power Supervisor Enable. Connect to GND if separate MSP430 low power supervisor is not used.
26	MSP_RDY	I/O	MSP_RDY, MSP430 Programmed Indication
27	RESERVED	I/O	Reserved, leave this pin open
28	RESERVED	I/O	Reserved, leave this pin open
29	RESERVED	I/O	Reserved, leave this pin open
30	RESERVED	I/O	Reserved, leave this pin open
31	RESERVED	I/O	Reserved, connect 10-k Ω pull-down resistor to GND. Do not leave open.

Table 1. bq500410A Pin Description (continued)

PIN		I/O	DESCRIPTION
NO.	NAME		
32	GND	—	GND
33	V33D	—	Digital Core 3.3-V supply. Be sure to decouple with bypass capacitors as close to the part as possible.
34	V33A	—	Analog 3.3-V supply. This pin can be derived from V33D supply, decouple with 22-Ω resistor and additional bypass capacitors
35	BPCAP	—	Bypass capacitor for internal 1.8-V core regulator. Connect bypass capacitor to GND
36	GND	—	GND
37	COMM_A+	I	Digital demodulation noninverting input A, connect parallel to input B+
38	COMM_A-	I	Digital demodulation inverting input A, connect parallel to input B-
39	COMM_B+	I	Digital demodulation noninverting input B, connect parallel to input A+
40	COMM_B-	I	Digital demodulation inverting input B, connect parallel to input A-
41	RESERVED	I	Reserved, leave this pin open
42	I_SENSE	I	Transmitter input current, used for parasitic loss calculations. Use 20-mΩ sense resistor and A=50 gain current sense amp
43	LOSS_THR	I	Input to program foreign metal object detection (FOD) threshold
44	LED_MODE	I	LED Mode Select
45	V_SENSE	I	Transmitter power train input voltage, used for FOD and Loss calculations. Voltage sample point should be after current input sense resistor. Use 76.8-kΩ to 10-kΩ divider to minimize quiescent loss.
46	V_IN	I	System input voltage selector. Connect this input to GND for 12-V operation.
47	GND	—	GND
48	ADCREF	I	External reference voltage input. Connect this input to GND.
49	EPAD	—	Flood with copper GND plane and stitch vias to PCB internal GND plane

Principles of Operation

Fundamentals

The principle of wireless power transfer is simply an open cored transformer consisting of a transmitter and receiver coils. The transmitter coil and electronics are typically built into a charger pad and the receiver coil and electronics are typically built into a portable device, such as a cell-phone.

When the receiver coil is positioned on the transmitter coil, magnetic coupling occurs once the transmitter coil is driven. The flux is coupled into the secondary coil which induces a voltage and current flows. The secondary voltage is rectified, and power can be transferred effectively to a load, wirelessly. Power transfer can be managed via any of various familiar closed-loop control schemes.

Wireless Power Consortium (WPC)

The Wireless Power Consortium (WPC) is an international group of companies from diverse industries. The WPC Standard was developed to facilitate cross compatibility of compliant transmitters and receivers. The standard defines the physical parameters and the communication protocol to be used in wireless power. For more information, or to download a copy of the WPC specification, go to <http://www.wirelesspowerconsortium.com/>.

Power Transfer

Power transfer depends on coil coupling. Coupling is dependant on the distance between coils, alignment, coil dimensions, coil materials, number of turns, magnetic shielding, impedance matching, frequency and duty cycle.

Most importantly, the receiver and transmitter coils must be aligned for best coupling and efficient power transfer. The closer the space between the coils is, the better the coupling. However, the practical distance is set to be less than 5 mm, as defined within the WPC Specification, to account for housing and interface surfaces.

Shielding is added as a backing to both the transmitter and receiver coils to direct the magnetic field to the coupled zone. Magnetic fields outside the coupled zone do not transfer power. Thus, shielding also serves to contain the fields to avoid coupling to other adjacent system components.

Regulation can be achieved by controlling any one of the coil coupling parameters. However, for WPC compatibility, the transmitter-side coils and capacitance are specified and the resonant frequency point is fixed. Power transfer is thus regulated by changing the frequency along the resonance curve from 112 kHz to 205 kHz, (that is the higher the frequency is, the lower the power). Duty cycle remains constant at 50% throughout the power band and is reduced only once 205 kHz is reached.

The WPC standard describes the dimensions, materials of the coils and information regarding the tuning of the coils to resonance. The value of the inductor and resonant capacitor are critical to proper operation and system efficiency.

Principles of Operation (continued)

Communication

Communication within the WPC is from the receiver to the transmitter, where the receiver tells the transmitter to send power and how much. In order to regulate, the receiver must communicate with the transmitter whether to increase or decrease frequency. The receiver monitors the rectifier output and using Amplitude Modulation (AM), sends packets of information to the transmitter. A packet is comprised of a preamble, a header, the actual message and a checksum, as defined by the WPC standard.

The receiver sends a packet by modulating an impedance network. This AM signal reflects back as a change in the voltage amplitude on the transmitter coil. The signal is demodulated and decoded by the transmitter-side electronics and the frequency of its coil-drive output is adjusted to close the regulation loop. The bq500410A features internal digital demodulation circuitry.

The modulated impedance network on the receiver can either be resistive or capacitive. Figure 1 shows the resistive modulation approach, where a resistor is periodically added to the load, Figure 2 shows the resulting amplitude change in the transmitter voltage. Figure 2 shows the capacitive modulation approach, where a capacitor is periodically added to the load and the resulting amplitude change in the transmitter voltage.

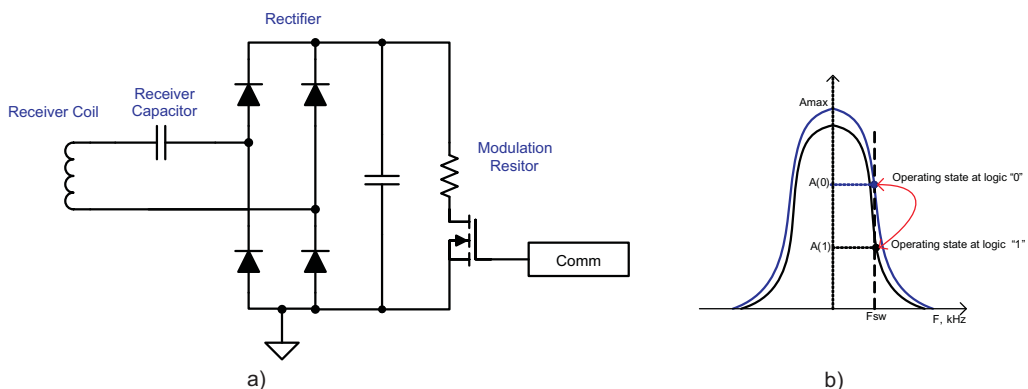

Figure 1. Receiver Resistive Modulation Circuit

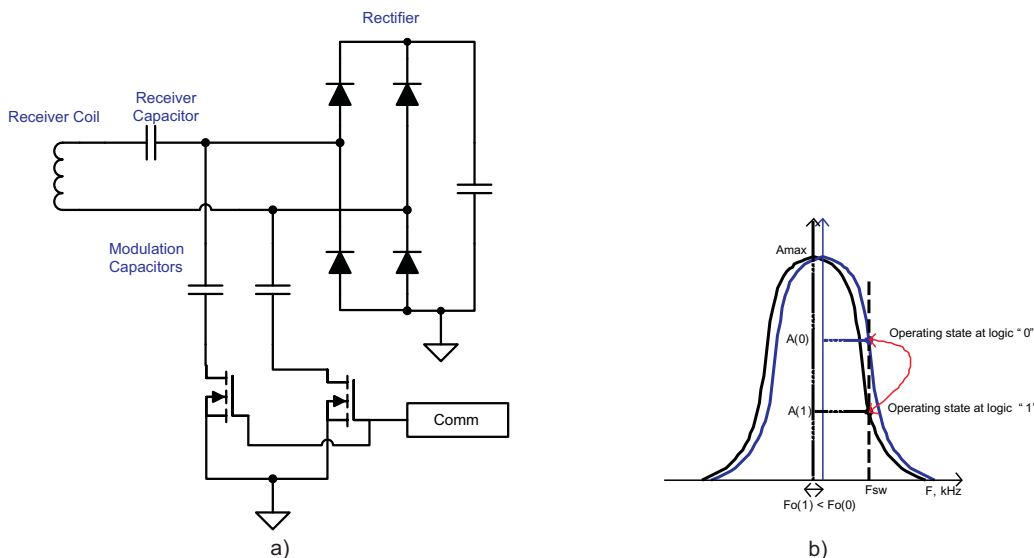

Figure 2. Receiver Capacitive Modulation Circuit

The bq500410A

Description of Operation

The bq500410A pings the surroundings in 400-ms intervals by sequentially firing the three coils in the array. The COMM feedback signal is multiplexed through analog switches and is synchronized to the coil being driven. To select the best coil match, the bq500410A looks for the strongest COMM signal. The coil is engaged and driven, note that only one coil is driven at a time. The driven coil is tolerant of slight misalignment of the RX while power is being transferred. Actually displacing the RX to an adjacent coil while charging is allowable, the sequential ping sequence and detection to determine the best matching coil to drive continues to repeat.

Capacitor Selection

Capacitor selection is critical to proper system operation. The total capacitance value of 2 nF x 68 nF (+5.6-nF center coil) is required in the resonant tank. This is the WPC system compatibility requirement, not a guideline.

NOTE

A total capacitance value of 2 nF x 68 nF/100 V (68 nF + 5.6 nF center coil) (C0G dielectric type) is required in the resonant tank to achieve the correct resonance frequency.

The capacitors chosen must be rated for at least 100 V and must be of a high quality C0G dielectric (sometimes also called NP0). These are typically available in a 5% tolerance, which is adequate. The use of X7R types or below is not recommended if WPC compliance is required because critical WPC Certification Testing, such as the minimum modulation or ensured power requirements, might fail.

The designer can combine capacitors to achieve the desired capacitance value. Various combinations can work depending on market availability. All capacitors must be of C0G types, not mixed with any other dielectric types.

A6 Coil Specification

The coil and matching capacitor specification for the A6 transmitter has been established by WPC Standard. This is fixed and cannot be changed on the transmitter side.

The bq500410A is primarily intended to drive a 3 coil array but it can also be used to drive a single coil. For single coil operation the two outer coils and associated electronics are simply omitted. Please refer to the application schematic at the end of this datasheet (See [Figure 6](#)).

Figure 3. Coil Specification Drawing

Table 2. Coil Specification

PARAMETER	SYMBOL	SPECIFICATION	UNIT
Outer length	Dol	53.2, (± 0.5)	mm
Inner length	Dil	27.5, (± 0.5)	
Outer width	Dow	45.2, (± 0.5)	
Inner width	Diw	19.5, (± 0.5)	
Thickness	Dc	1.5, (± 0.5)	
Turns	N	12	Turns
Layers	-	1	
Odd displacement	Doo	49.2, (± 4)	mm
Even displacement	Doe	24.6, (± 2)	

NOTE

The performance of an A6 transmitter can vary based on the design of the A6 coil set. For best performance with small receiver coils under heavy loading, it is best to design the coil set such that the Doo dimension is on the low end of the specified tolerance.

For a current list of coil vendors please see:

- *bqTESLA Transmitter Coil Vendors*, [Texas Instruments Literature Number SLUA649](#)

Option Select Pins

Two pins (pin 43 and pin 44) on the bq500410A are allocated to program the Loss Threshold and the LED mode of the device. At power up, a bias current is applied to pins LED_MODE and LOSS_THR and the resulting voltage measured in order to identify the value of the attached programming resistor. The values of the operating parameters set by these pins are determined using Table 4. For LED_MODE, the selected bin determines the LED behavior based on Table 3; for the LOSS_THR, the selected bin sets a threshold used for parasitic metal object detection (see Parasitic Metal Detection (PMOD) and Foreign Object Detection (FOD) section).

Figure 4. Option Programming

LED Modes

The bq500410A can directly drive two LED outputs (pin 7 and pin 8) through a simple current limit resistor (typically 470 Ω), based on the mode selected. The two current limit resistors can be individually adjusted to tune or match the brightness of the two LEDs. Do not exceed the maximum output current rating of the device.

The selection resistor connected between pin 44 and GND selects one of the desired LED indication schemes presented in Table 3.

Table 3. LED Modes

LED CONTROL OPTION	LED SELECTION RESISTOR	DESCRIPTION	LED	OPERATIONAL STATES				
				STANDBY	POWER TRANSFER	CHARGE COMPLETE	FAULT	PMOD or FOD WARNING
0	<36.5 kΩ	LEDs off						
1	42.2 kΩ	Generic	LED1, Green	Off	Blink slow ⁽¹⁾	On	Off	Off
			LED2, Red	Off	Off	Off	On	Blink fast ⁽²⁾
2	48.7 kΩ	Generic + standby	LED1, Green	On	Blink slow ⁽¹⁾	On	Off	Off
			LED2, Red	On	Off	Off	On	Blink fast ⁽²⁾
3	56.2 kΩ	Generic Opt 1	LED1, Green	Off	Off	On	Off	Off
			LED2 Red	Off	On	Off	Blink fast ⁽²⁾	On
4	64.9 kΩ	Generic Opt 2	LED1, Green	Off	On	Off	Off	Off
			LED2 Red	Off	Off	Off	On	Blink fast ⁽²⁾
	> 75 kΩ	Reserved						

(1) Blink slow = 0.625 Hz

(2) Blink fast = 2.5 Hz

Parasitic Metal Object Detect (PMOD) and Foreign Object Detection (FOD)

The bq500410A is WPC1.1 ready and supports both enhanced PMOD and FOD features by continuously monitoring the input voltage and current to calculate input power. Combining input power, known losses, and the value of power reported by the RX device being charged, the bq500410A can estimate how much power is unaccounted for and presumed lost due to metal objects placed in the wireless power transfer path. If this unexpected loss exceeds the threshold set by the LOSS_THR resistor, a fault is indicated and power transfer is halted. Whether the PMOD or the FOD algorithm is used is determined by the ID packet of the receiver being charged.

PMOD has certain inherent weaknesses as rectified power is not ensured to be accurate per WPC1.0 Specification. The user has the flexibility to adjust the LOSS_THR resistor or to disable PMOD by leaving pin 43 open should issues with compliance or interoperability arise.

The FOD algorithm uses information from an in-system characterized and WPC1.1 certified RX and it is therefore more accurate. Where the WPC1.0 specification requires merely the Rectified Power packet, the WPC1.1 specification additionally uses the Received Power packet which more accurately tracks power used by the receiver.

As default, PMOD and FOD share the same LOSS_THR setting resistor for which the recommended starting point is 400 mW (selected by a 56.2-k Ω resistor on the LOSS_THR option pin 43). If, for some reason, the application requires disabling one or the other or setting separate PMOD and FOD thresholds, [Figure 5](#) can be used.

Resistor R39 sets the FOD threshold and R24 sets the PMOD threshold in this configuration. The control lines (FOD and PMOD) are driven briefly at power-up when the resistor values are read.

To selectively disable PMOD support, R24 and Q8-B should be omitted from the above design.

Table 4. Option Select Bins

BIN NUMBER	RESISTANCE (kΩ)	LOSS THRESHOLD (mW)
0	<36.5	250
1	42.2	300
2	48.7	350
3	56.2	400
4	64.9	450
5	75.0	500
6	86.6	550
7	100	600
8	115	650
9	133	700
10	154	750
11	178	800
12	205	850
13	>237	Feature Disabled

Figure 5. LOSS_THR Connection Circuits

NOTE

Either one of these circuits is connected to LOSS_THR, but not both.

Shut Down by Thermal Sensor or Trigger

Typical applications of the bq500410A does not require additional thermal protection. This shutdown feature is provided for enhanced applications and is not limited to thermal shutdown. The key parameter is the 1.0-V threshold on pin 2. Voltage below 1.0 V on pin 2 causes the device to shut down.

The application of thermal monitoring via a Negative Temperature Coefficient (NTC) sensor, for example, is straightforward. The NTC forms the lower leg of a temperature dependant voltage divider. The NTC leads are connected to the bq500410A device, pin 2 and GND. The threshold on pin 2 is set to 1.0 V, below which the system shuts down and a fault is indicated (depending on LED mode chosen).

To implement this feature follow these steps:

1. Consult the NTC datasheet and find the resistance vs temperature curve.
2. Determine the actual temperature where the NTC will be placed by using a thermal probe.
3. Read the NTC resistance at that temperature in the NTC datasheet, that is R_{NTC}.
4. Use the following formula to determine the upper leg resistor (R_{Setpoint}):

$$R_Setpoint = 2.3 \times R_NTC \tag{1}$$

The system restores normal operation after approximately five minutes or if the receiver is removed. If the feature is not used, this pin must be pulled high.

NOTE

Pin 2 must always be terminated, else erratic behavior may result.

Fault Handling and Indication

The following is a table of End Power Transfer (EPT) packet responses, fault conditions, the duration how long the condition lasts until a retry is attempted. The LED mode selected determines how the LED indicates the condition or fault.

Table 5. Fault Handling and Indication

CONDITION	DURATION (before retry)	HANDLING
EPT-00	Immediate	Unknown
EPT-01	5 seconds	Charge complete
EPT-02	Infinite	Internal fault
EPT-03	5 minutes	Over temperature
EPT-04	Immediate	Over voltage
EPT-05	Immediate	Over current
EPT-06	Infinite	Battery failure
EPT-07	Not applicable	Reconfiguration
EPT-08	Immediate	No response
OVP (over voltage)	Immediate	
OC (over current)	1 minute	
NTC (external sensor)	5 minutes	
PMOD/FOD warning	12 seconds	10 seconds LED only, 2 seconds LED + buzzer
PMOD/FOD	5 minutes	

Power Transfer Start Signal

The bq500410A features two signal outputs to indicate that power transfer has begun. Pin 23 outputs a 400-ms duration, 4-kHz square wave for driving low cost AC type ceramic buzzers. Pin 24 outputs logic high, also for 400 ms, which is suitable for DC type buzzers with built-in tone generators, or as a trigger for any type of customized indication scheme. Do not exceed 4 mA loading from either of these pins which is more than adequate for small signaling and actuation. If not used, these pins should be left open.

Power-On Reset

The bq500410A has an integrated Power-On Reset (POR) circuit which monitors the supply voltage and handles the correct device startup sequence. Additional supply voltage supervisor or reset circuits are not needed.

External Reset, $\overline{\text{RESET}}$ Pin

The bq500410A can be forced into a reset state by an external circuit connected to the $\overline{\text{RESET}}$ pin. A logic low voltage on this pin holds the device in reset. For normal operation, this pin is pulled up to 3.3 V_{CC} with a 10-k Ω pull-up resistor.

Trickle Charge and CS100

CS100 is supported. If CS100 is reported by the RX, the bq500410A indicates that charge is complete.

The WPC specification provides an End-of-Power Transfer message (EPT) to indicate charge complete. Upon receipt of the charge complete message, the bq500410A changes the LED indication to solid green LED output and halt power transfer for 5 seconds. Subsequently, transmitters pings the receiver again to see if its status has changed, assuming it receives another EPT, the LED mode stays the same.

The WPC specification also provides reporting of the level of battery charge (Charge Status). In some battery charging applications there is a benefit to continue the charging process in trickle-charge mode to top off the battery. The bq500410A changes the LED indication to reflect charge complete when a 'Charge Status 100%' message is received, but unlike the response to an EPT message, it does not halt power transfer while the LED is solid green. The RX, the mobile device being charged, uses a CS100 packet to enable trickle charge mode.

Current Monitoring Requirements

The bq500410A is WPC1.1 ready. In order to enable the PMOD or FOD features, current monitoring must be provided in the design.

Current monitoring is optional however, it is used for the foreign metal protection features and over current protection. The system designer can choose not to include the current monitor and remain WPC1.0 compliant. Alternately, the additional current monitoring circuitry can be added to the hardware design but not loaded. This would enable a forward migration path to future WPC1.1 compatibility.

For proper scaling of the current monitor signal, the current sense resistor should be 20 m Ω and the current shunt amplifier should have a gain of 50, such as the INA199A1. The current sense resistor has a temperature stability of ± 200 PPM. Proper current sensing techniques in the application hardware should also be observed.

Over-Current Protection

The bq500410A has an integrated current protection feature which monitors the input current reported by the current sense resistor and amplifier. If the input current exceeds a safety threshold, a fault is indicated and power transfer is halted for one minute.

If this feature is desired, the sense resistor and amplifier are required. If this feature is not desired, the I_SENSE input pin to the bq500410A (pin 42) should be grounded.

NOTE

Always terminate the I_SENSE pin (pin 42), either with the output of a current monitor circuit or by connecting to ground.

MSP430G2101 Low Power Supervisor

This is an optional low-power feature. By adding the MSP430G2101, as recommended in the bq500410A application schematic, the bq500410A device is periodically shut down to conserve power, yet all relevant states are recalled and all running LED status indicators remain active.

Since the bq500410A needs an external low-power mode to significantly reduce power consumption, the most direct way to reduce power is to remove its supply and completely shut it down. In doing so, however, the bq500410A goes through a reset and any data in memory would be lost. Important information regarding charge state, fault condition, operating mode and indicator pins driven would be cleared.

The MSP430G2101, in its role as a low-power supervisor, is used to provide accurate 'ping' timing, retains charge state, operating mode, fault condition and all relevant operation states. The LEDs are now driven and controlled by the MSP430, not the bq500410A, which directly drives and maintains the LED status indication during the bq500410A reset periods. Since the LED indicators are now driven by the MSP430G2101, care should be taken not to exceed the pin output current drive limit.

Using the suggested circuitry, a standby power reduction from 300 mW to less than 90 mW can be expected making it possible to achieve Energy Star rating.

The user does not need to program the MSP430G2101, an off-the-shelf part can be used. The required MSP430G2101 firmware is embedded in the bq500410A and is boot loaded at first power up, similar to a field update. The MSP430G2101 code cannot be modified by the user.

NOTE

The user cannot program the MSP430G2101 in this system.

All Unused Pins

All unused pins can be left open unless otherwise indicated. Please refer to [Table 1](#). Grounding of unused pins, if it is an option, can improve PCB layout.

APPLICATION INFORMATION

Overview

The application schematic for the transmitter with reduced standby power is shown in [Figure 7](#).

CAUTION

Please check the bq500410A product page for the most up-to-date schematic and list of materials reference design package before starting a new project.

Input Regulator

The bq500410A requires 3.3 V_{DC} to operate. A buck regulator or a linear regulator can be used to step down from the 12-V system input. Either choice is fully WPC compatible, the decision lies in the user's requirements with respect to cost or efficiency.

The application example circuit utilizes a low-cost buck regulator, TPS54231.

Power Trains

The bq500410A drives three independent half bridges. Each half bridge drives one coil from the coil set assembly. The TPS28225 is the recommended driver device for this application. It features high-side drive capability which enables the use of N-channel MOSFETs throughout. Gate-drive supply can be derived from a primitive active voltage divider. A highly regulated supply is not required to drive MOSFET gates.

Signal Processing Components

The COMM signal used to control power transfer is derived from the coil voltage. Each coil has its own signal processing chain. The coil voltage is AC coupled and divided down to a manageable level and biased to a 1-V offset. Series connected diodes are provided for protection from any possible transients. The three signal processing chains are then multiplexed together via analog switches. Thus, the correct signal processing chain and COMM signal used to control power transfer is from the coil being driven.

Low-Power Supervisor

Power reduction is achieved by periodically disabling the bq500410A while LED and housekeeping control functions are continued by U4, the low-cost, low quiescent current micro controller MSP430G2101. When U4 is present in the circuit (which is set by a pull-up resistor on bq500410A pin 25), the bq500410A at first power-up boots the MSP430G2101 with the necessary firmware and the two chips operate in tandem. During standby operation, the bq500410A periodically issues SLEEP command, Q1 pulls the supply to the bq500410A, therefore eliminating its power consumption. Meanwhile, the MSP430G2101 maintains the LED indication and stores previous charge state during this bq500410A reset period. This bq500410A off period is set by the MSP430G2101. WPC compliance mandates the power transmitter controller, bq500410A, awakes every 400 ms to produce an analog ping and check if a valid device is present. This time constant can not be altered to further reduce power.

Disabling Low-Power Supervisor Mode

For lowest cost or if the low-power supervisor is not needed, please refer to [Figure 8](#) for an application schematic example.

Input Power Requirements

For full wireless power system capability and WPC compliance, the AC power adapter selected for the application should have a minimum rating of 12 V at 750 mA.

PCB Layout

Careful PCB layout practice is critical to proper system operation. There are many references on proper PCB layout techniques. A few good tips are repeated here:

The TX layout requires a 4-layer PCB layout for best ground plane technique. A 2-layer PCB layout can be achieved though not as easily. Ideally, the approach to the layer stack-up has been:

- Layer 1 component placement and as much ground plane as possible.
- Layer 2 clean ground.
- Layer 3 finish routing.
- Layer 4 clean ground.

Thus, the circuitry is virtually sandwiched between grounds. This minimizes EMI noise emissions and also provides a noise free voltage reference plane for device operation.

Keep as much copper as possible. Make sure the bq500410A GND pins and the power pad have a continuous flood connection to the ground plane. The power pad should also be stitched to the ground plane, which also acts as a heat sink for the bq500410A. A good GND reference is necessary for proper bq500410A operation, such as analog-digital conversion, clock stability and best overall EMI performance.

Separate the analog ground plane from the power ground plane and use only ONE tie point to connect grounds. Having several tie points defeats the purpose of separating the grounds!

The COMM return signal from the resonant tank should be routed as a differential pair. This is intended to reduce stray noise induction. The frequencies of concern warrant low-noise analog signaling techniques, such as differential routing and shielding, but the COMM signal lines do not need to be impedance matched.

The DC-to-DC buck regulator used from the 12-V input supplies the bq500410A with 3.3 V. Typically a single-chip controller solution with integrated power FET and synchronous rectifier or outboard diode is used. Pull in the buck inductor and power loop as close as possible to create a tight loop. Likewise, the power-train, full-bridge components should be pulled together as tight as possible. See the bq500410A EVM for an example of a good layout technique.

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

(2) Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check <http://www.ti.com/productcontent> for the latest availability information and additional product content details.

TBD: The Pb-Free/Green conversion plan has not been defined.

Pb-Free (RoHS): TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

Pb-Free (RoHS Exempt): This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

Green (RoHS & no Sb/Br): TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

(3) MSL, Peak Temp. -- The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) Only one of markings shown within the brackets will appear on the physical device.

PLASTIC QUAD FLATPACK NO-LEAD

4204101/F 06/11

- NOTES:
- A. All linear dimensions are in millimeters. Dimensioning and tolerancing per ASME Y14.5M-1994.
 - B. This drawing is subject to change without notice.
 - C. Quad Flatpack, No-leads (QFN) package configuration.
 - D. The package thermal pad must be soldered to the board for thermal and mechanical performance.
 - E. See the additional figure in the Product Data Sheet for details regarding the exposed thermal pad features and dimensions.
 - F. Falls within JEDEC MO-220.

THERMAL INFORMATION

This package incorporates an exposed thermal pad that is designed to be attached directly to an external heatsink. The thermal pad must be soldered directly to the printed circuit board (PCB). After soldering, the PCB can be used as a heatsink. In addition, through the use of thermal vias, the thermal pad can be attached directly to the appropriate copper plane shown in the electrical schematic for the device, or alternatively, can be attached to a special heatsink structure designed into the PCB. This design optimizes the heat transfer from the integrated circuit (IC).

For information on the Quad Flatpack No-Lead (QFN) package and its advantages, refer to Application Report, QFN/SON PCB Attachment, Texas Instruments Literature No. SLUA271. This document is available at www.ti.com.

The exposed thermal pad dimensions for this package are shown in the following illustration.

NOTE: All linear dimensions are in millimeters

RGZ (S-PVQFN-N48)

PLASTIC QUAD FLATPACK NO-LEAD

- NOTES:
- All linear dimensions are in millimeters.
 - This drawing is subject to change without notice.
 - Publication IPC-7351 is recommended for alternate designs.
 - This package is designed to be soldered to a thermal pad on the board. Refer to Application Note, Quad Flat-Pack Packages, Texas Instruments Literature No. SLUA271, and also the Product Data Sheets for specific thermal information, via requirements, and recommended board layout. These documents are available at www.ti.com <<http://www.ti.com>>.
 - Laser cutting apertures with trapezoidal walls and also rounding corners will offer better paste release. Customers should contact their board assembly site for stencil design recommendations. Refer to IPC 7525 for stencil design considerations.
 - Customers should contact their board fabrication site for recommended solder mask tolerances and via tenting recommendations for vias placed in the thermal pad.

IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All semiconductor products (also referred to herein as "components") are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its components to the specifications applicable at the time of sale, in accordance with the warranty in TI's terms and conditions of sale of semiconductor products. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by applicable law, testing of all parameters of each component is not necessarily performed.

TI assumes no liability for applications assistance or the design of Buyers' products. Buyers are responsible for their products and applications using TI components. To minimize the risks associated with Buyers' products and applications, Buyers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI components or services are used. Information published by TI regarding third-party products or services does not constitute a license to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of significant portions of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI components or services with statements different from or beyond the parameters stated by TI for that component or service voids all express and any implied warranties for the associated TI component or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyer acknowledges and agrees that it is solely responsible for compliance with all legal, regulatory and safety-related requirements concerning its products, and any use of TI components in its applications, notwithstanding any applications-related information or support that may be provided by TI. Buyer represents and agrees that it has all the necessary expertise to create and implement safeguards which anticipate dangerous consequences of failures, monitor failures and their consequences, lessen the likelihood of failures that might cause harm and take appropriate remedial actions. Buyer will fully indemnify TI and its representatives against any damages arising out of the use of any TI components in safety-critical applications.

In some cases, TI components may be promoted specifically to facilitate safety-related applications. With such components, TI's goal is to help enable customers to design and create their own end-product solutions that meet applicable functional safety standards and requirements. Nonetheless, such components are subject to these terms.

No TI components are authorized for use in FDA Class III (or similar life-critical medical equipment) unless authorized officers of the parties have executed a special agreement specifically governing such use.

Only those TI components which TI has specifically designated as military grade or "enhanced plastic" are designed and intended for use in military/aerospace applications or environments. Buyer acknowledges and agrees that any military or aerospace use of TI components which have **not** been so designated is solely at the Buyer's risk, and that Buyer is solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI has specifically designated certain components as meeting ISO/TS16949 requirements, mainly for automotive use. In any case of use of non-designated products, TI will not be responsible for any failure to meet ISO/TS16949.
